

Dependency Grammars and Parser

LING 571 — Deep Processing for NLP

October 20, 2021

Shane Steinert-Threlkeld

Announcements

- Patas is back!
 - HW2 due tonight
 - *No homework out today*
 - HW3 due next Wednesday

Ambiguity of the Week

Adam Macqueen
@adam_macqueen

Personally feel not enough hospitals are named after sandwiches.

Ambiguity of the Week 2

“What if my pet is not made of chicken and turkey?” —my brother

Roadmap

- Dependency Grammars
 - Definition
 - Motivation:
 - Limitations of Context-Free Grammars
- Dependency Parsing
 - By conversion to CFG
 - By Graph-based models
 - By transition-based parsing
- HW4 + mid-term feedback

Dependency Grammar

- [P]CFGs:
 - Phrase-Structure Grammars
 - Focus on modeling constituent structure

Dependency Grammar

- **[P]CFGs:**
 - Phrase-Structure Grammars
 - Focus on modeling constituent structure
- **Dependency grammars:**
 - Syntactic structure described in terms of
 - Words
 - Syntactic/semantic relations between words

Dependency Parse

- A Dependency parse is a tree,* where:

Dependency Parse

- A Dependency parse is a tree,* where:
 - Nodes correspond to words in string

Dependency Parse

- A Dependency parse is a tree,* where:
 - Nodes correspond to words in string
 - Edges between nodes represent dependency relations
 - Relations may or may not be labeled (aka typed)
- *: in very special cases, can argue for cycles

Dependency Parse Example:

They hid the letter on the shelf

Argument Dependencies	
Abbreviation	Description
nsubj	nominal subject
csbj	clausal subject
dobj	direct object
iobj	indirect object
pobj	object of preposition
Modifier Dependencies	
Abbreviation	Description
tmod	temporal modifier
appos	appositional modifier
det	determiner
prep	prepositional modifier

Dependency Parse Example:

They hid the letter on the shelf

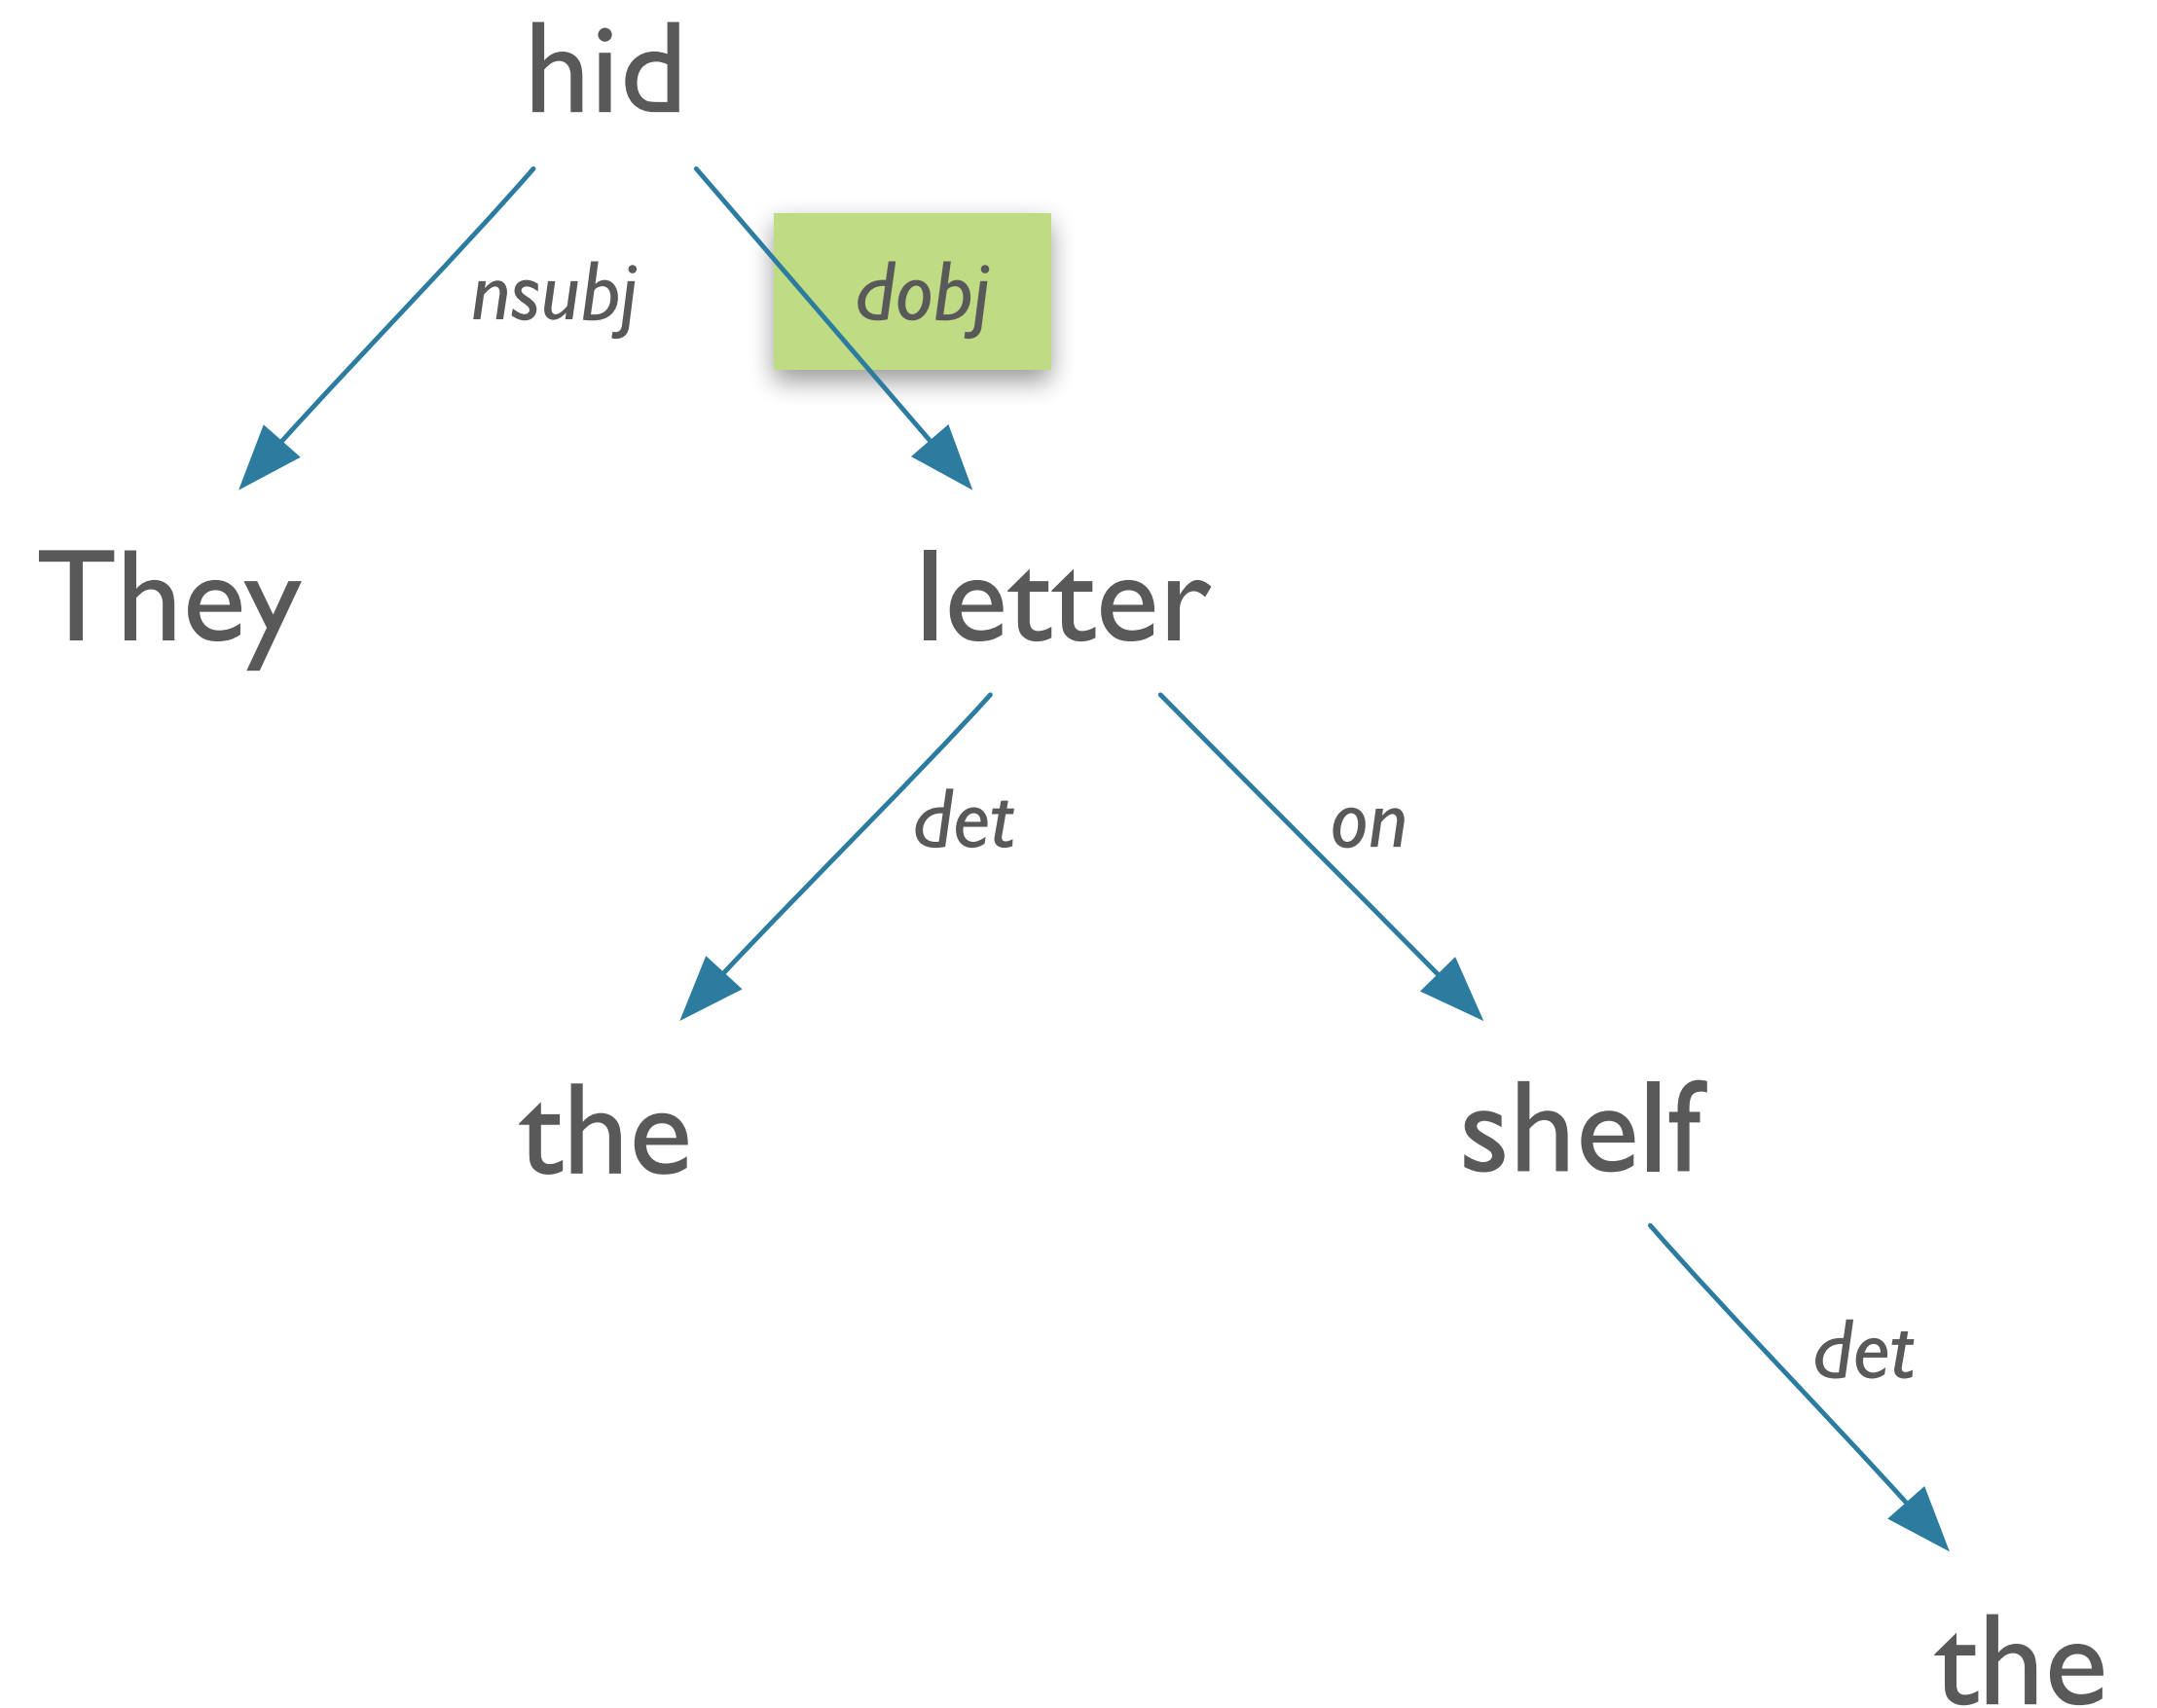

Argument Dependencies	
Abbreviation	Description
nsubj	nominal subject
csbj	clausal subject
dobj	direct object
iobj	indirect object
pobj	object of preposition
Modifier Dependencies	
Abbreviation	Description
tmod	temporal modifier
appos	appositional modifier
det	determiner
prep	prepositional modifier

Dependency Parse Example:

They hid the letter on the shelf

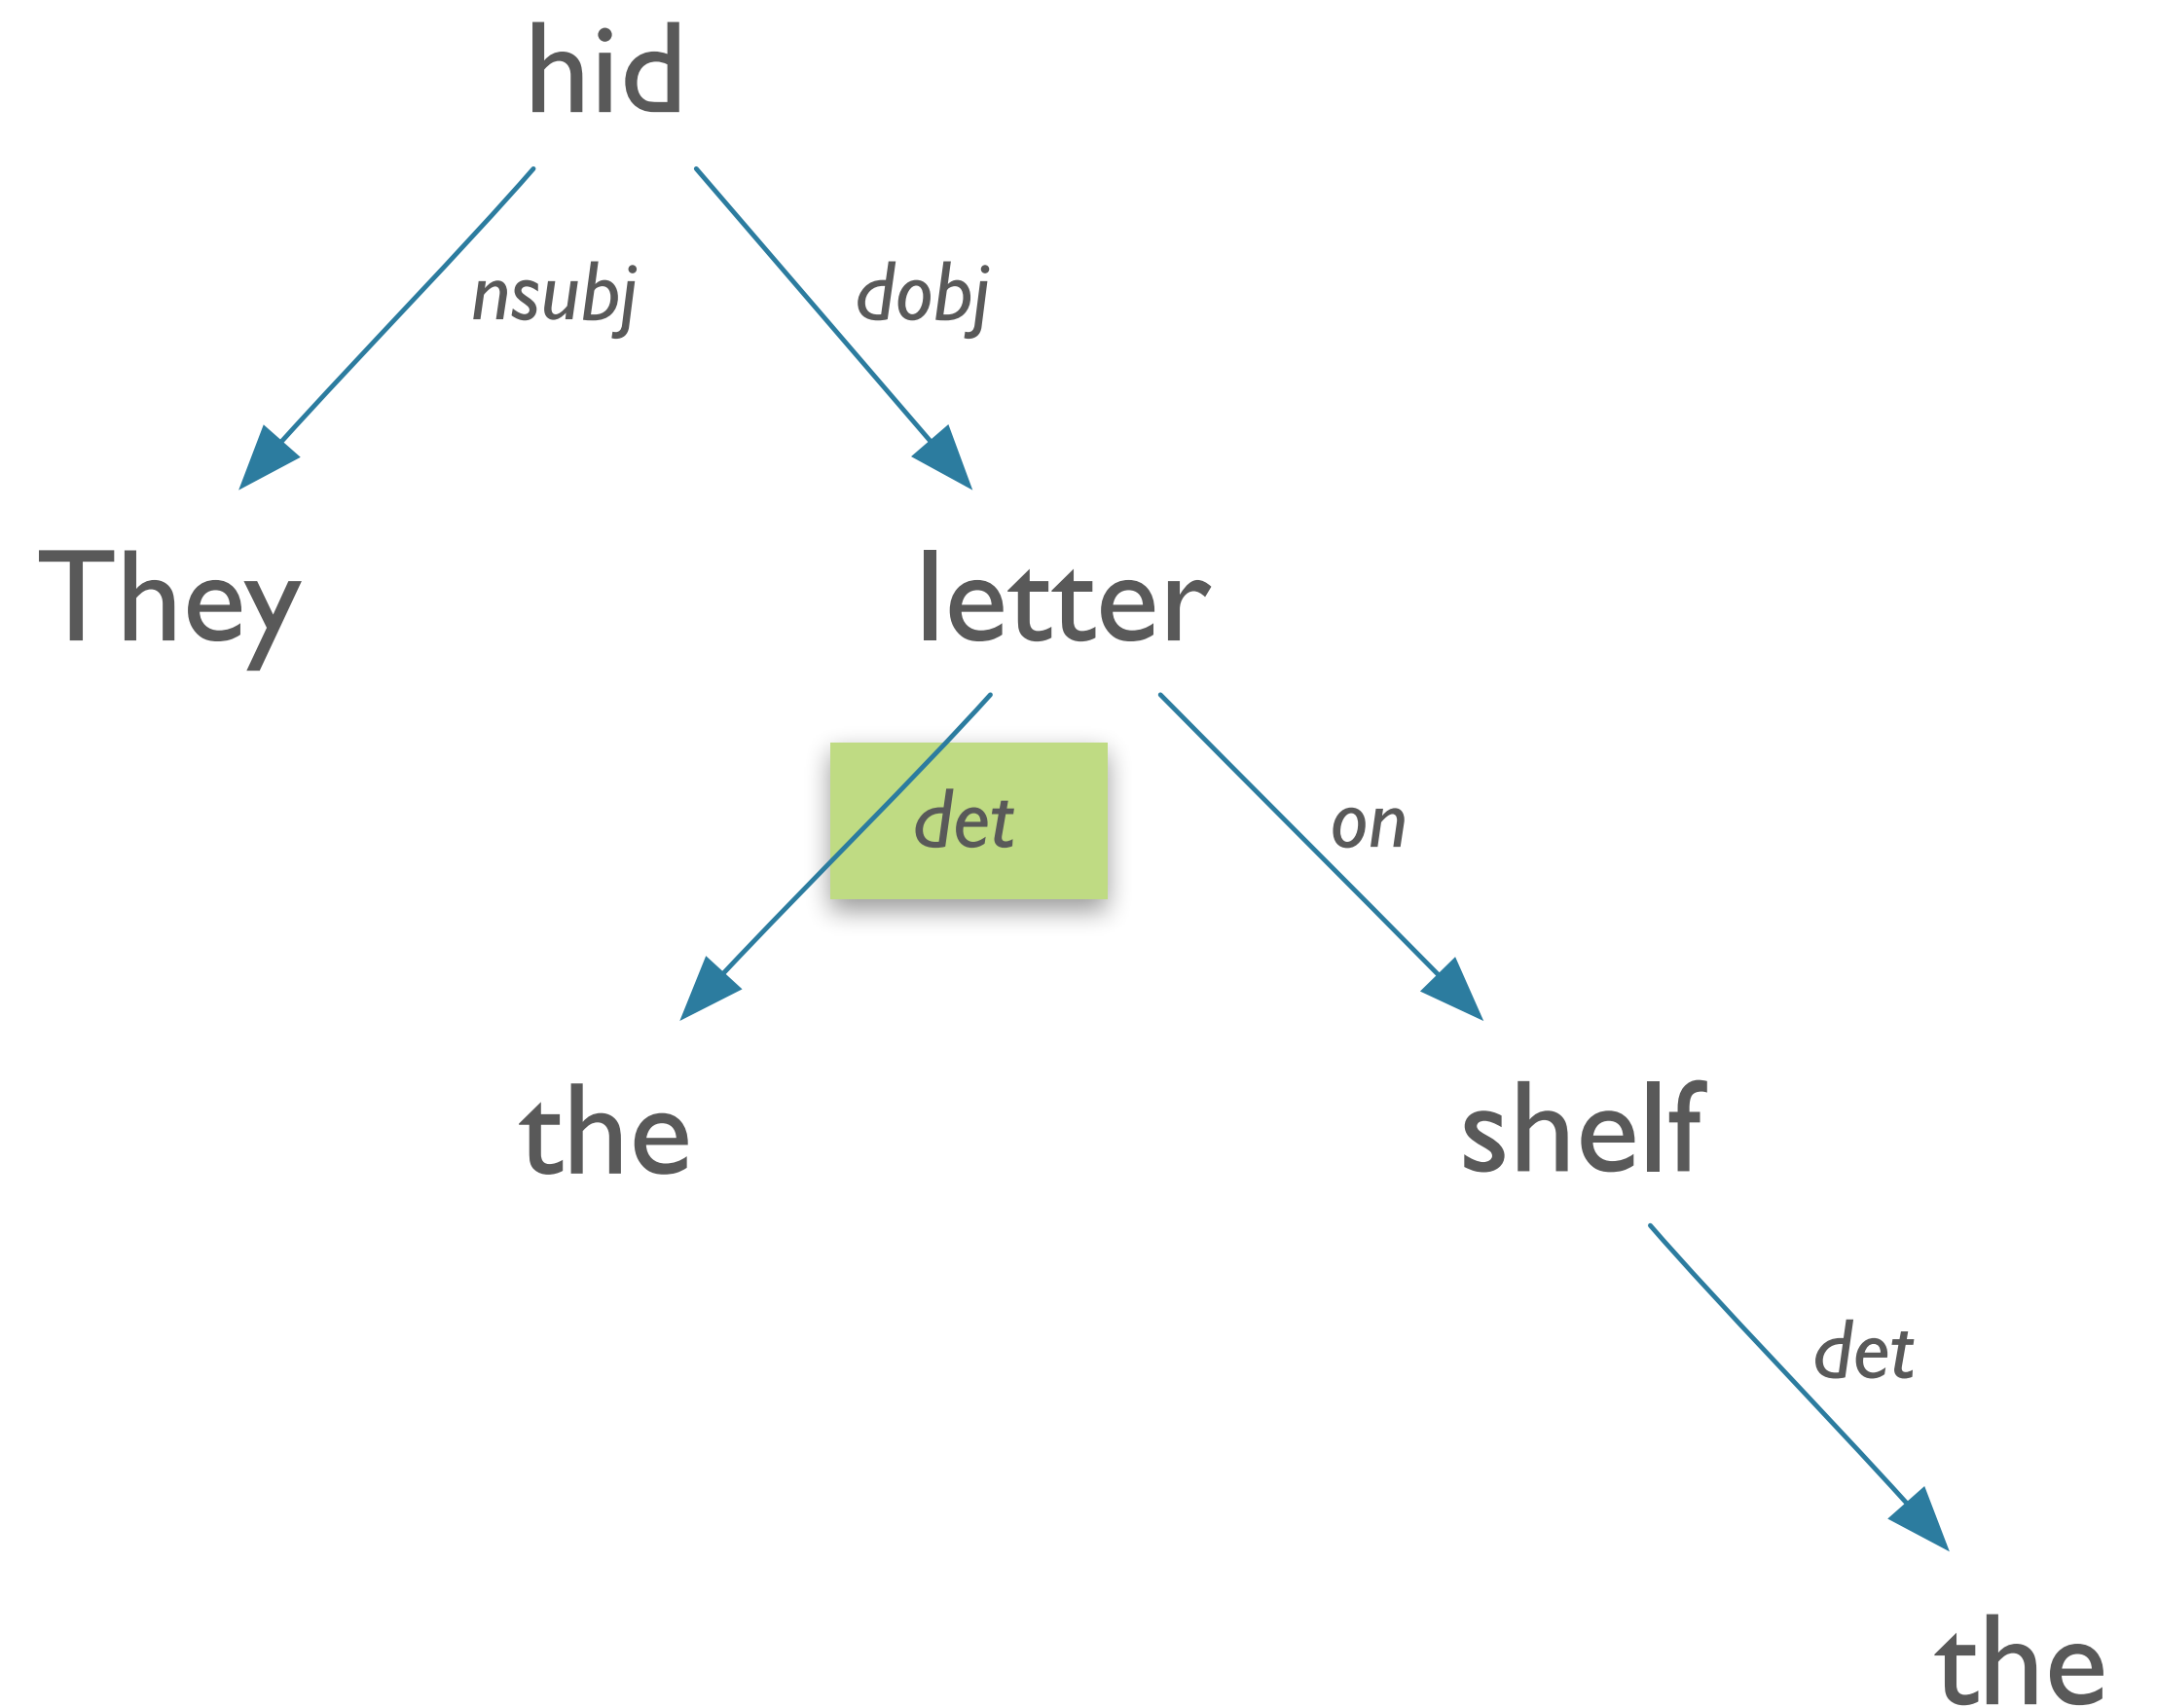

Argument Dependencies	
Abbreviation	Description
nsubj	nominal subject
csbj	clausal subject
dobj	direct object
iobj	indirect object
pobj	object of preposition
Modifier Dependencies	
Abbreviation	Description
tmod	temporal modifier
appos	appositional modifier
det	determiner
prep	prepositional modifier

Dependency Parse Example:

They hid the letter on the shelf

Argument Dependencies	
Abbreviation	Description
nsubj	nominal subject
csbj	clausal subject
dobj	direct object
iobj	indirect object
pobj	object of preposition
Modifier Dependencies	
Abbreviation	Description
tmod	temporal modifier
appos	appositional modifier
det	determiner
prep	prepositional modifier

Alternative Representation

Why Dependency Grammar?

- More natural representation for many tasks

Why Dependency Grammar?

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure

Why Dependency Grammar?

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure
 - Phrase structure may obscure, e.g. *wh-movement*

Why Dependency Grammar?

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure
 - Phrase structure may obscure, e.g. *wh-movement*
- Good match for question-answering, relation extraction

Why Dependency Grammar?

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure
 - Phrase structure may obscure, e.g. *wh-movement*
- Good match for question-answering, relation extraction
 - *Who* did *what* to *whom*?

Why Dependency Grammar?

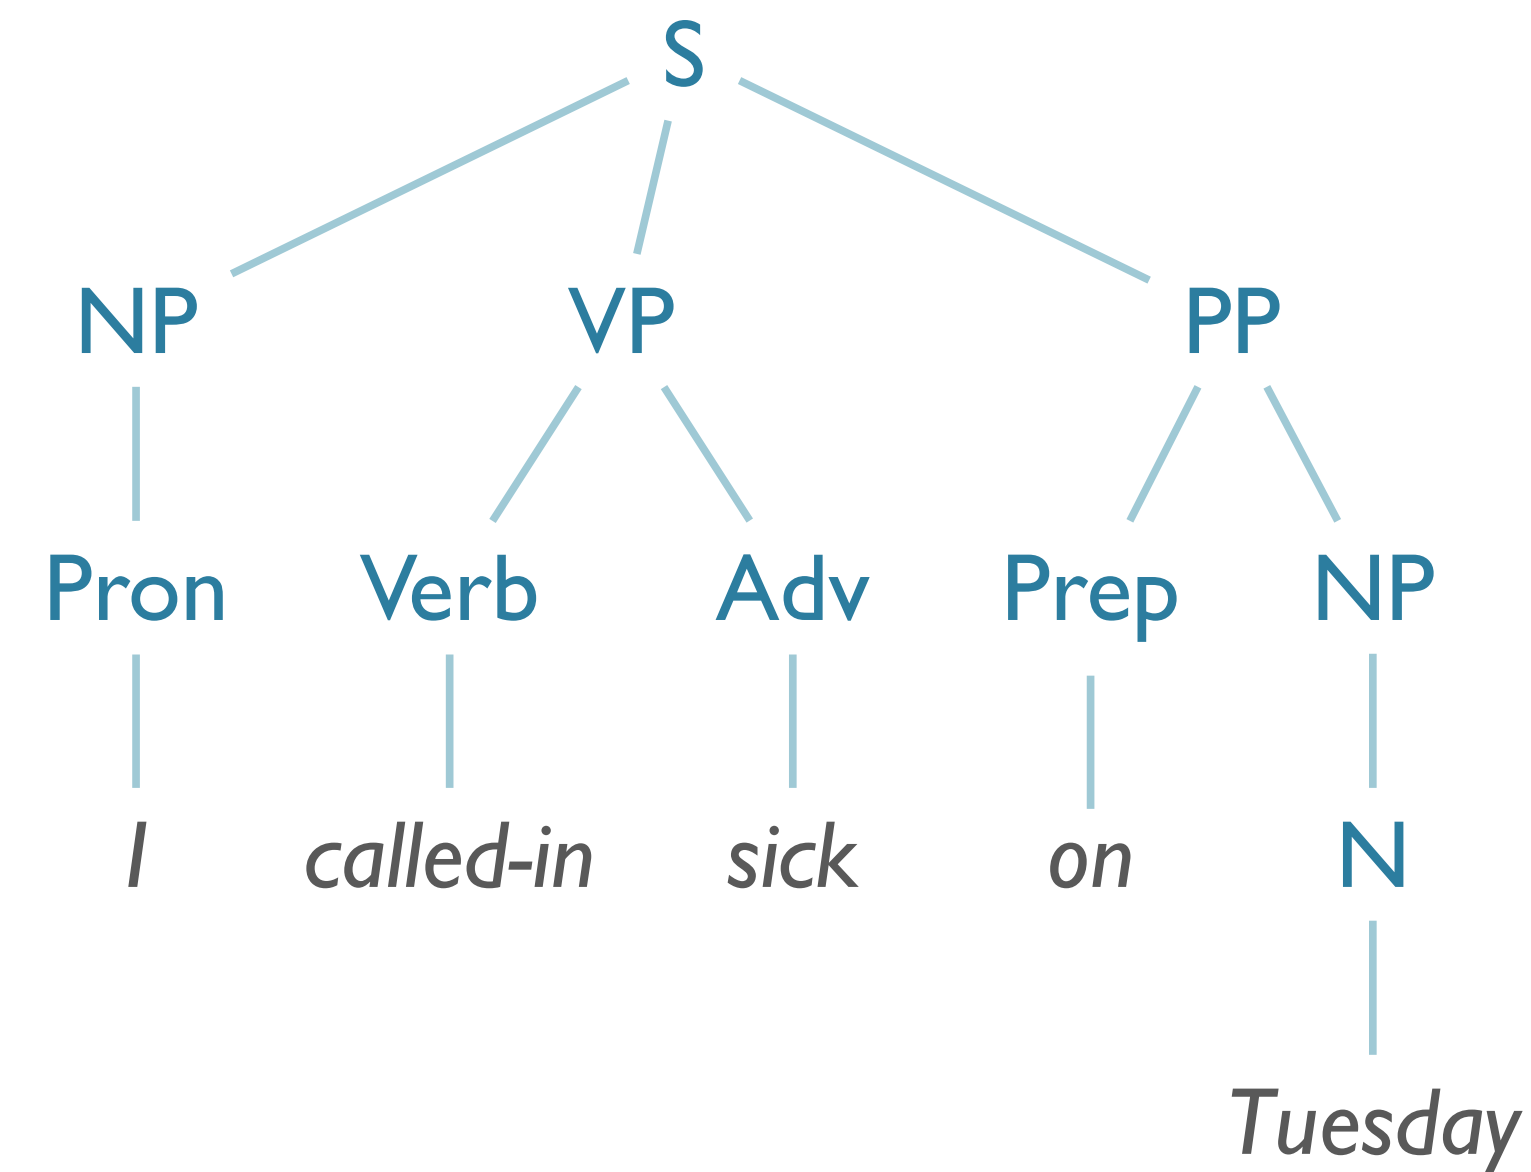

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure
 - Phrase structure may obscure, e.g. *wh-movement*
- Good match for question-answering, relation extraction
 - *Who* did *what* to *whom*?
 - = (*Subject*) did (*theme*) to (*patient*)

Why Dependency Grammar?

- More natural representation for many tasks
 - Clear encapsulation of predicate-argument structure
 - Phrase structure may obscure, e.g. *wh-movement*
- Good match for question-answering, relation extraction
 - *Who* did *what* to *whom*?
 - = (*Subject*) did (*theme*) to (*patient*)
 - Helps with parallel relations between roles in questions, and roles in answers

Why Dependency Grammar?

- Easier handling of flexible or free word order
- How does CFG handle variation in word order?

Why Dependency Grammar?

- Easier handling of flexible or free word order
- How does CFG handle variation in word order?

$S \rightarrow PP\ NP\ VP$

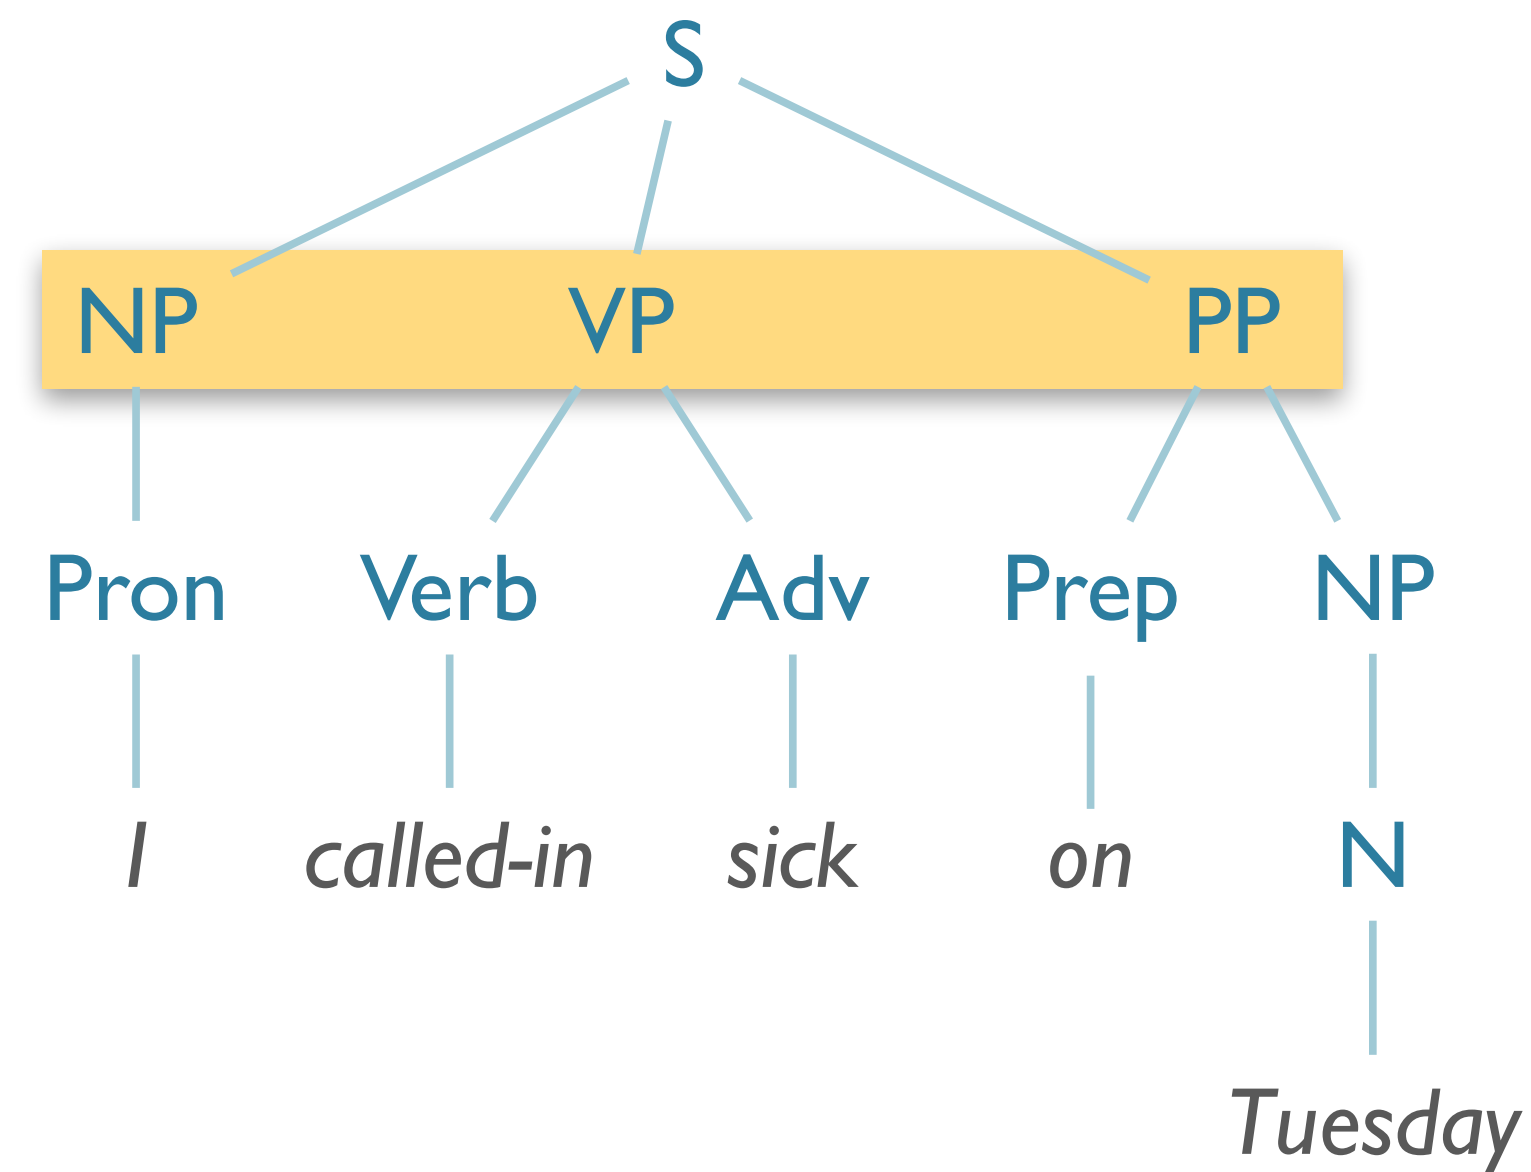

Why Dependency Grammar?

- Easier handling of flexible or free word order
- How does CFG handle variation in word order?

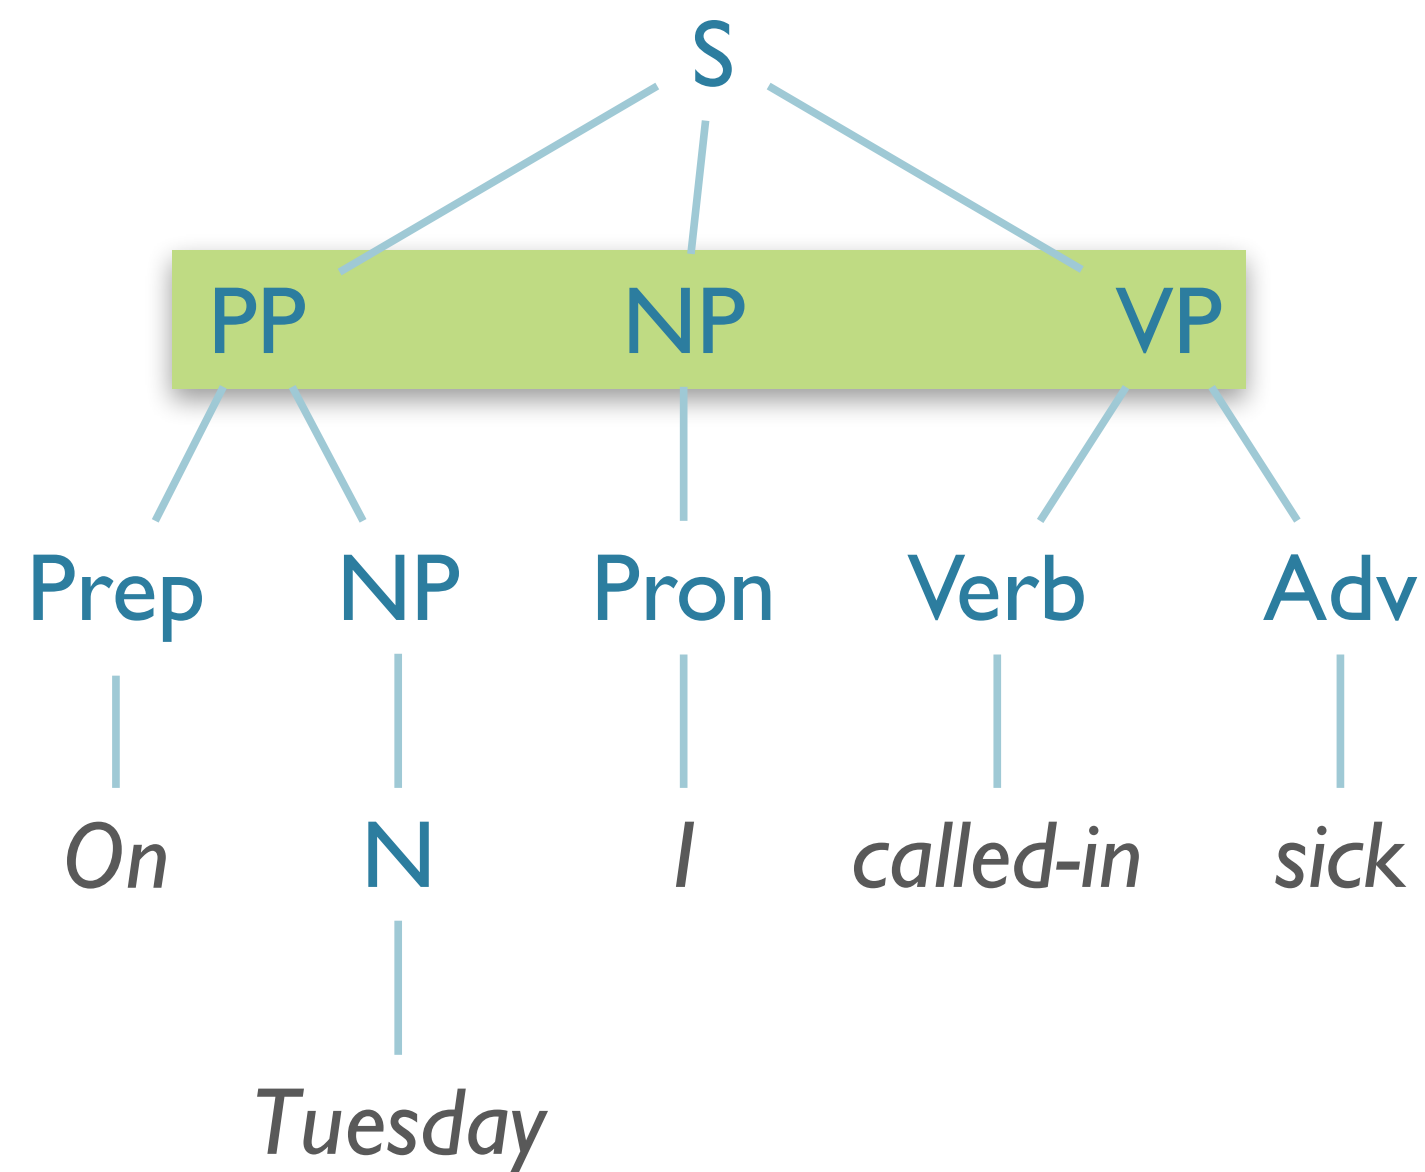

$S \rightarrow PP\ NP\ VP$

$S \rightarrow NP\ VP\ PP$

Why Dependency Grammar?

- English has relatively fixed word order
- Big problem for languages with freer word order

$S \rightarrow PP\ NP\ VP$

$S \rightarrow NP\ VP\ PP$

Why Dependency Grammar?

- How do dependency structures represent the difference?

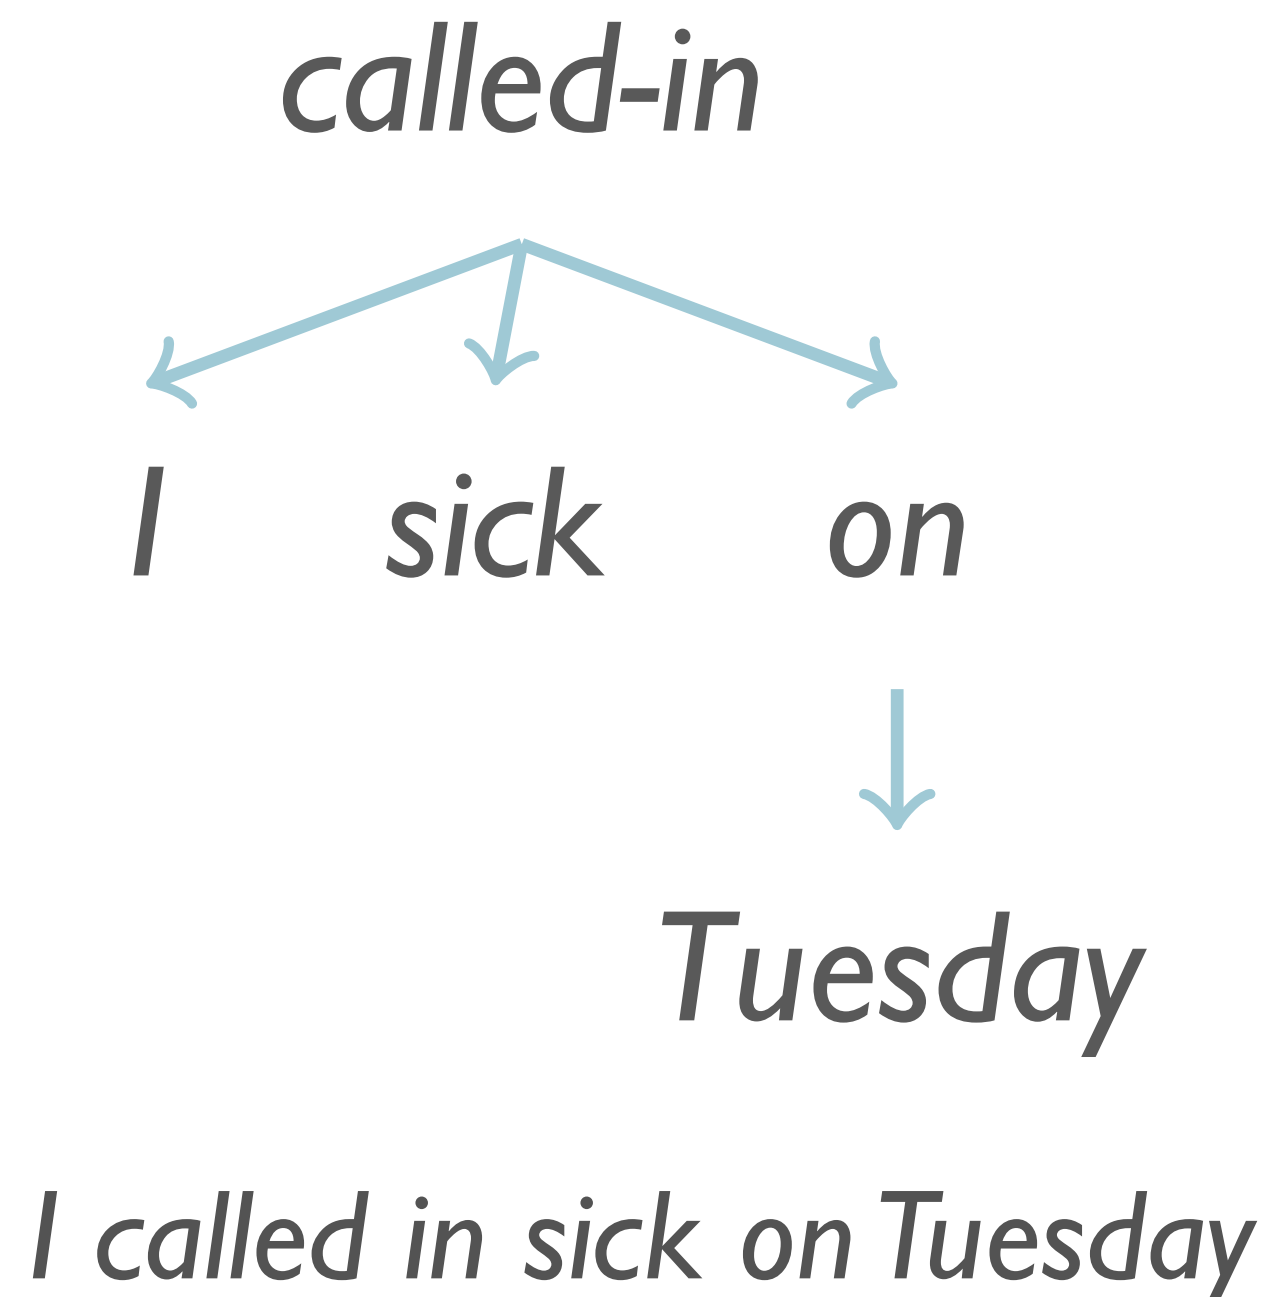

Why Dependency Grammar?

- How do dependency structures represent the difference?
 - Same structure

Why Dependency Grammar?

- How do dependency structures represent the difference?
 - Same structure
 - Relationships are between words, order insensitive

Why Dependency Grammar?

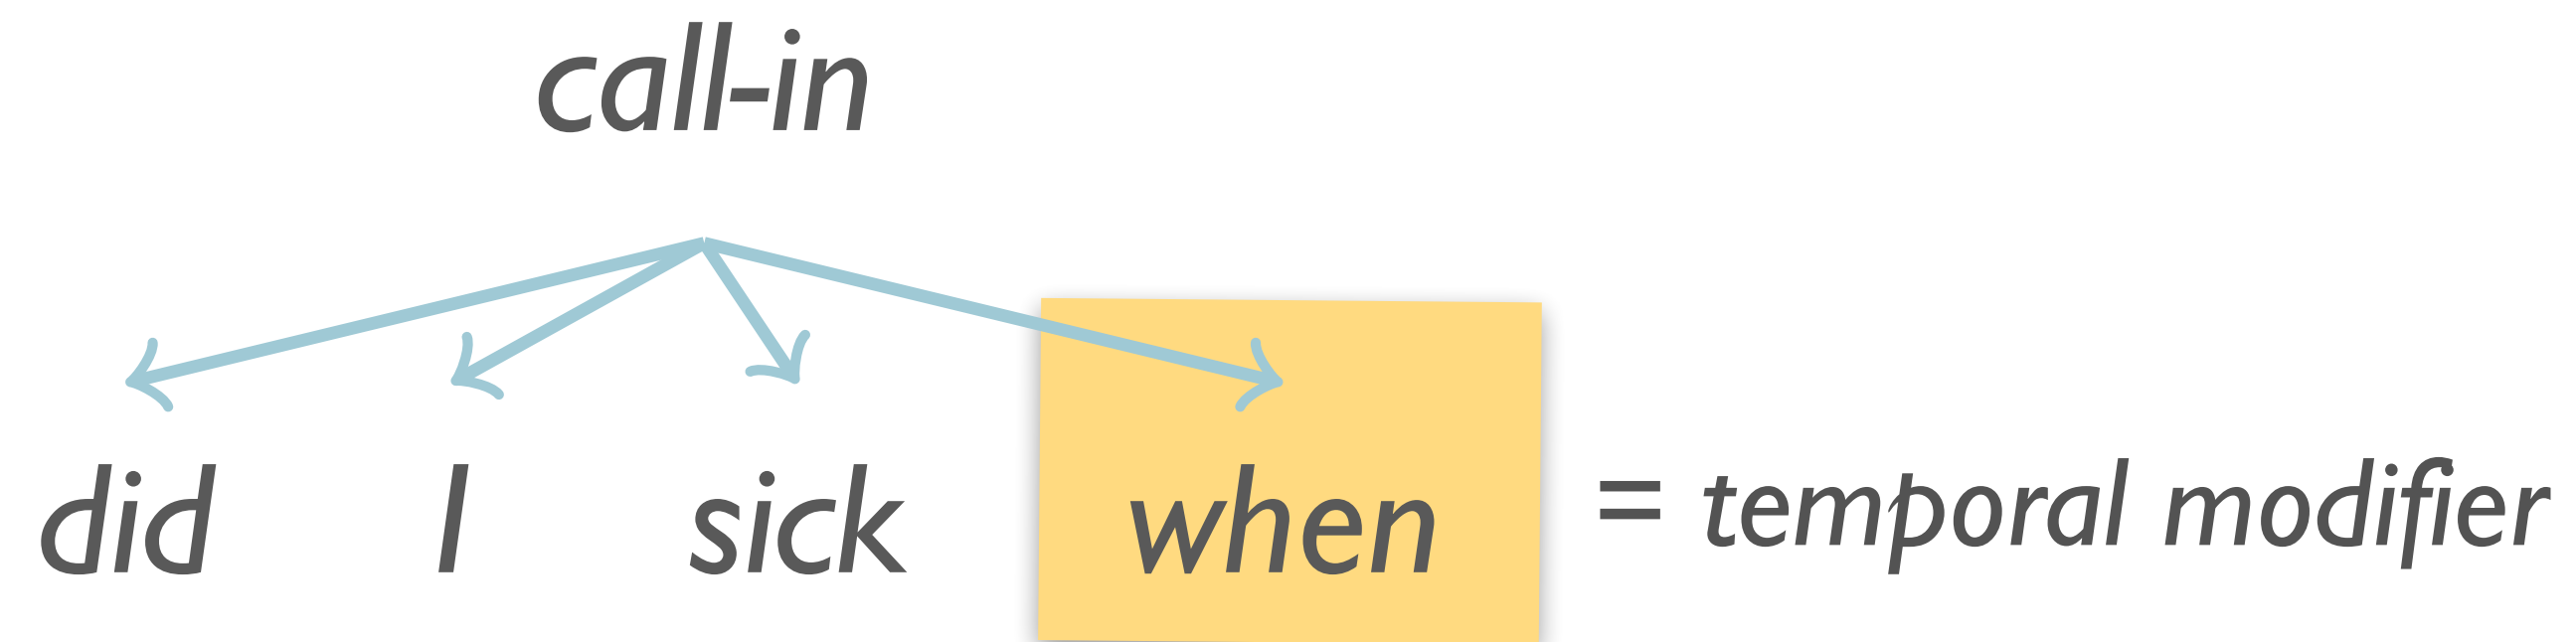

- How do dependency structures represent the difference?
 - Same structure
 - Relationships are between words, order insensitive

I called in sick on Tuesday

Why Dependency Grammar?

- How do dependency structures represent the difference?
 - Same structure
 - Relationships are between words, order insensitive

when did I call in sick?

Natural Efficiencies

- Phrase Structures:
 - Must derive full trees of many non-terminals

Natural Efficiencies

- Phrase Structures:
 - Must derive full trees of many non-terminals
- Dependency Structures:
 - For each word, identify
 - Syntactic head, h
 - Dependency label, d

Natural Efficiencies

- Phrase Structures:
 - Must derive full trees of many non-terminals
- Dependency Structures:
 - For each word, identify
 - Syntactic head, h
 - Dependency label, d
 - Inherently lexicalized
 - Strong constraints hold between pairs of words

Visualization

- Web demos:
 - displaCy: <https://explosion.ai/demos/displacy>
 - Stanford CoreNLP: <http://corenlp.run/>
- [spaCy](#) and [stanza](#) Python packages have good built-in parsers
- LaTeX: tikz-dependency (<https://ctan.org/pkg/tikz-dependency>)

```
>>> import stanfordnlp
>>> stanfordnlp.download('en') # This downloads the English models for the neural pipeline
>>> nlp = stanfordnlp.Pipeline() # This sets up a default neural pipeline in English
>>> doc = nlp("Barack Obama was born in Hawaii. He was elected president in 2008.")
>>> doc.sentences[0].print_dependencies()

('Barack', '4', 'nsubj:pass')
('Obama', '1', 'flat')
('was', '4', 'aux:pass')
('born', '0', 'root')
('in', '6', 'case')
('Hawaii', '4', 'obl')
('.', '4', 'punct')
```

Resources

- Universal Dependencies:
 - Consistent annotation scheme (i.e. same POS, dependency labels)
 - Treebanks for >70 languages
 - Sizes: German, Czech, Japanese, Russian, French, Arabic, ...

Upcoming UD Languages

▶		Assamese	1	-		IE, Indic
▶		Bengali	2	-	 	IE, Indic
▶		Bhojpuri	1	-		IE, Indic
▶		Cusco Quechua	1	-		Quechuan
▶		Dargwa	1	-		Nakho-Dagestanian
▶		Georgian	1	-		Kartvelian
▶		Kannada	1	-		Dravidian, Southern
▶		Komi Permyak	1	-		Uralic, Permic
▶		Kyrgyz	1	-		Turkic, Northwestern
▶		Livvi	1	-		Uralic, Finnic
▶		Macedonian	1	-		IE, Slavic
▶		Pnar	1	-		Austro-Asiatic, Khasian
▶		Romansh	2	-		IE, Romance
▶		Scottish Gaelic	1	-		IE, Celtic
▶		Shipibo Konibo	1	-		Panoan
▶		Sindhi	1	-		IE, Indic
▶		Somali	1	-		Afro-Asiatic, Cushitic

▶		Swiss German	1	-		IE, Germanic

Summary

- Dependency grammars balance complexity and expressiveness
 - Sufficiently expressive to capture predicate-argument structure
 - Sufficiently constrained to allow efficient parsing

Summary

- Dependency grammars balance complexity and expressiveness
 - Sufficiently expressive to capture predicate-argument structure
 - Sufficiently constrained to allow efficient parsing
- Still not perfect
 - “On Tuesday I called in sick” vs. “I called in sick on Tuesday”
 - These feel pragmatically different (e.g. topically), might want to represent difference syntactically.

Roadmap

- Dependency Grammars
 - Definition
 - Motivation:
 - Limitations of Context-Free Grammars
- **Dependency Parsing**
 - By conversion from CFG
 - By Graph-based models
 - By transition-based parsing

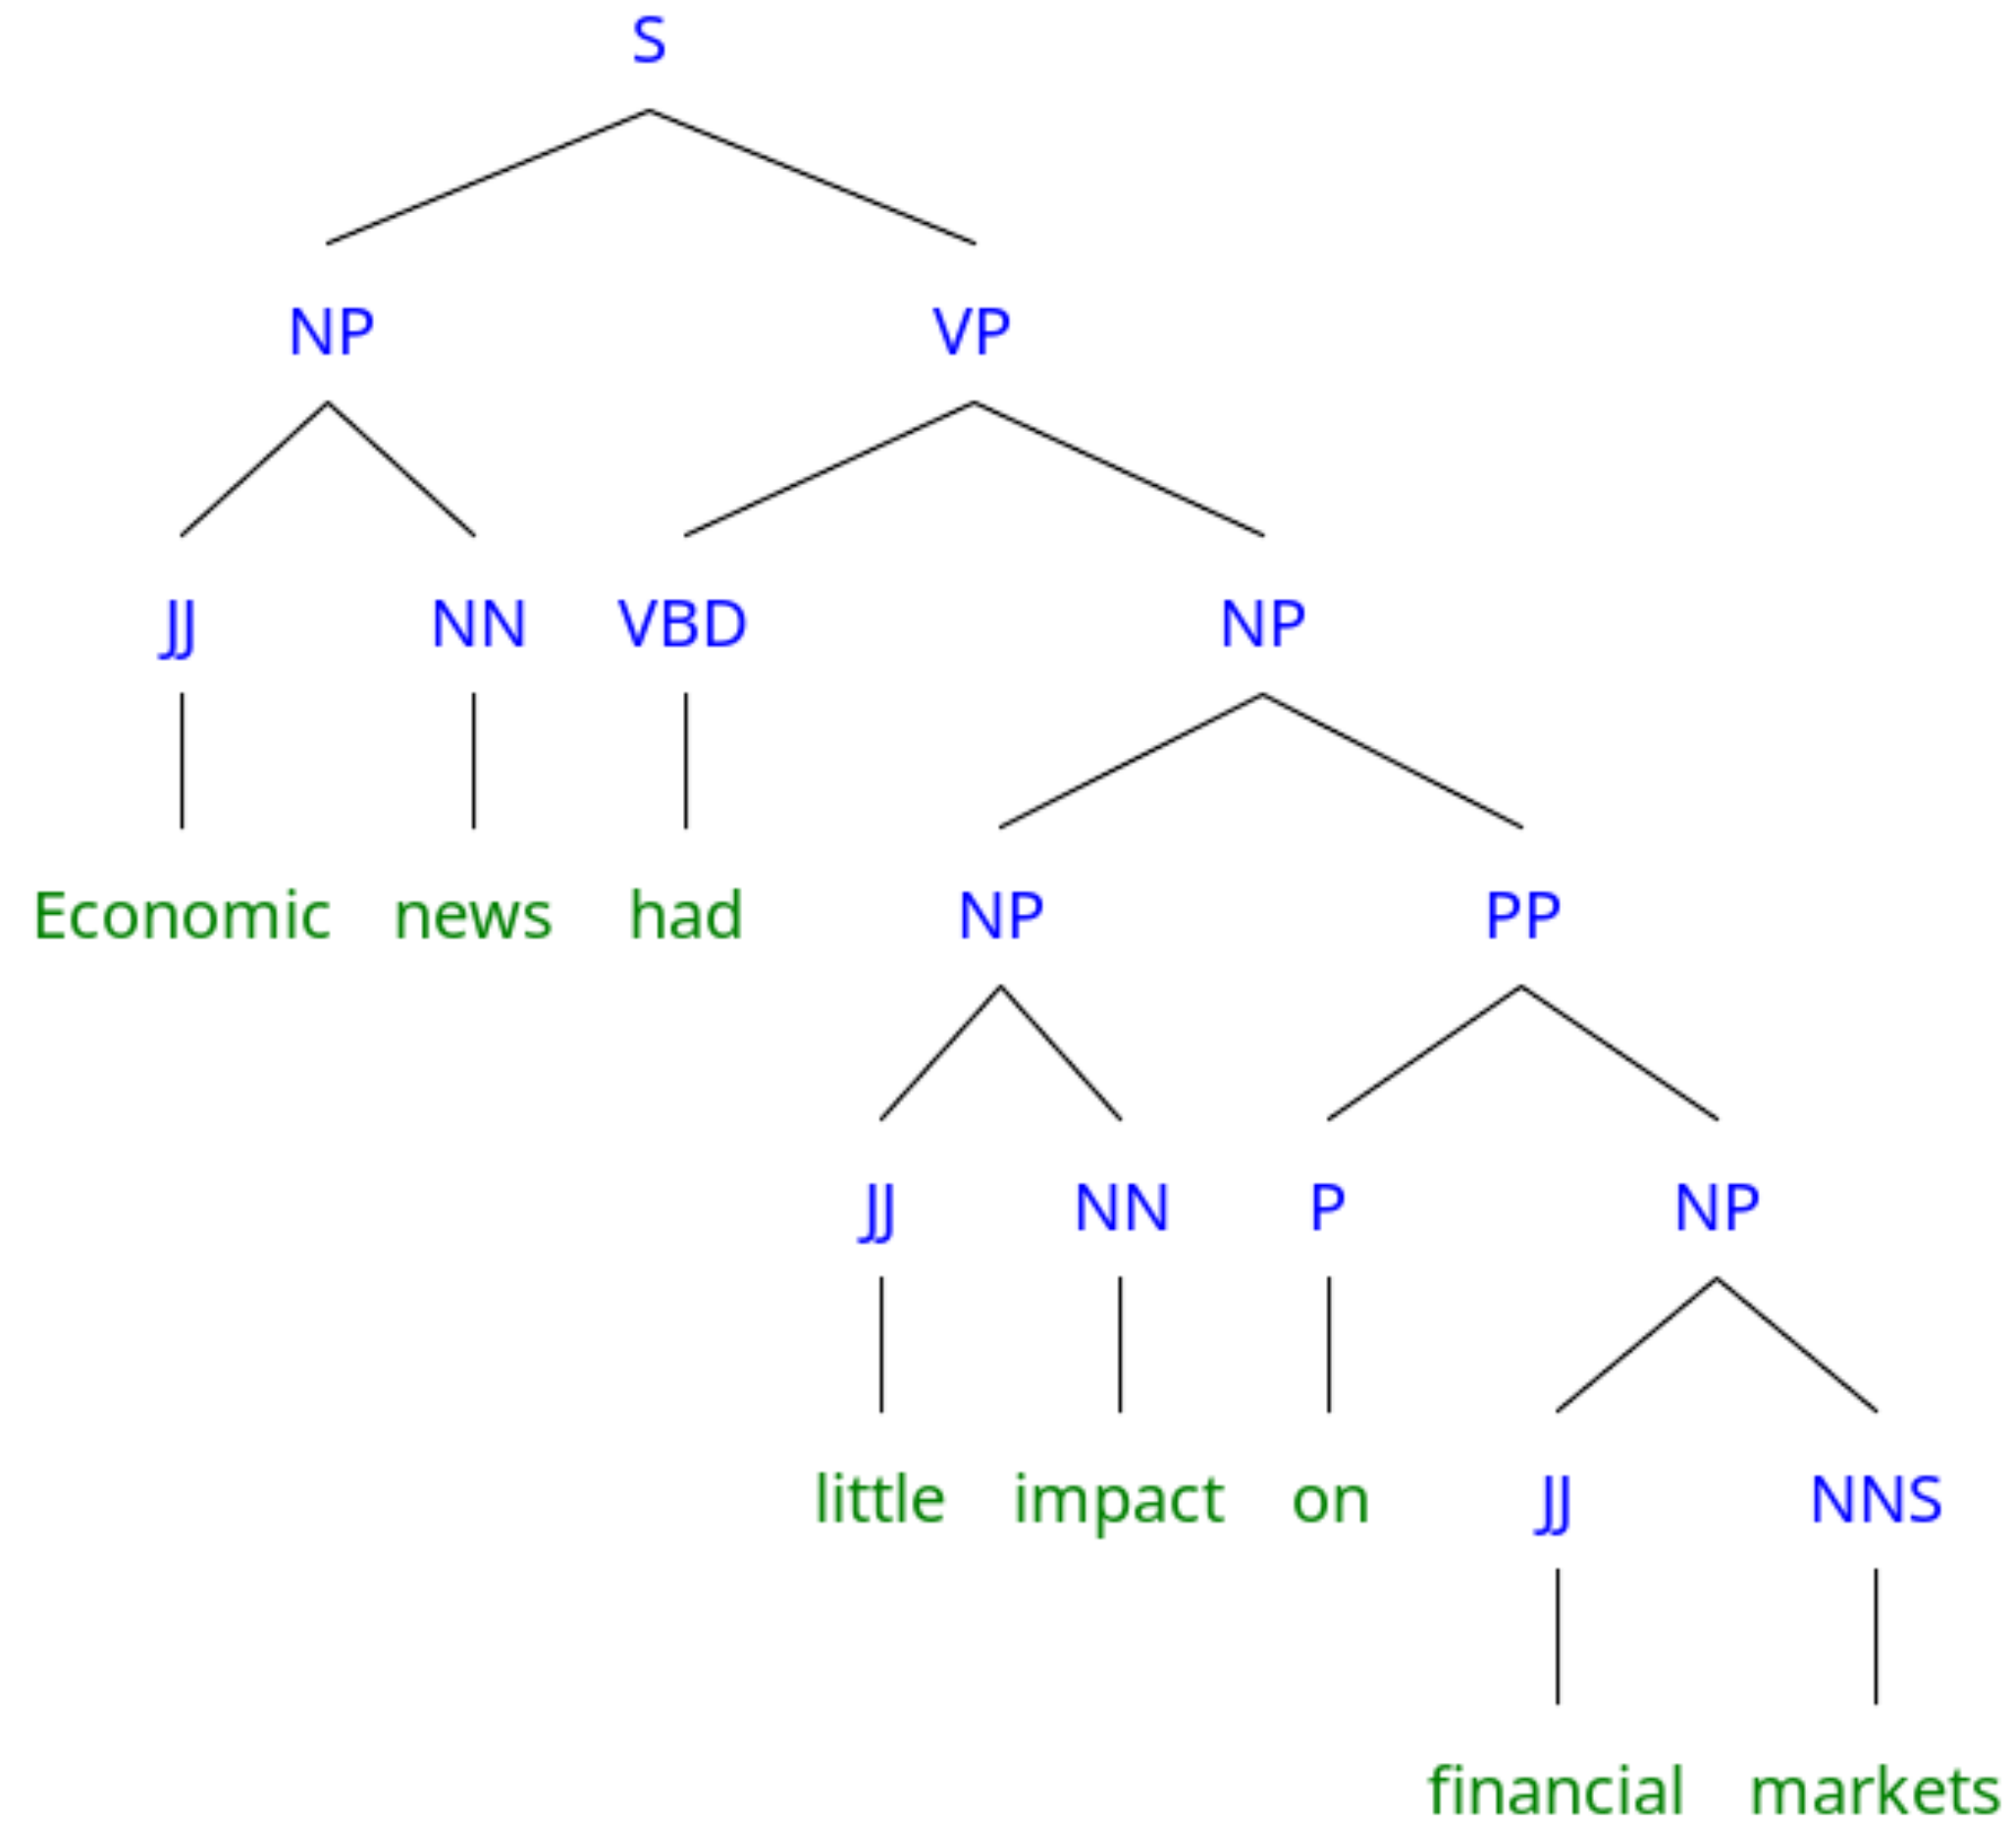

Conversion: PS \rightarrow DS

- Can convert Phrase Structure (PS) to Dependency Structure (DS)
 - ...without the dependency labels

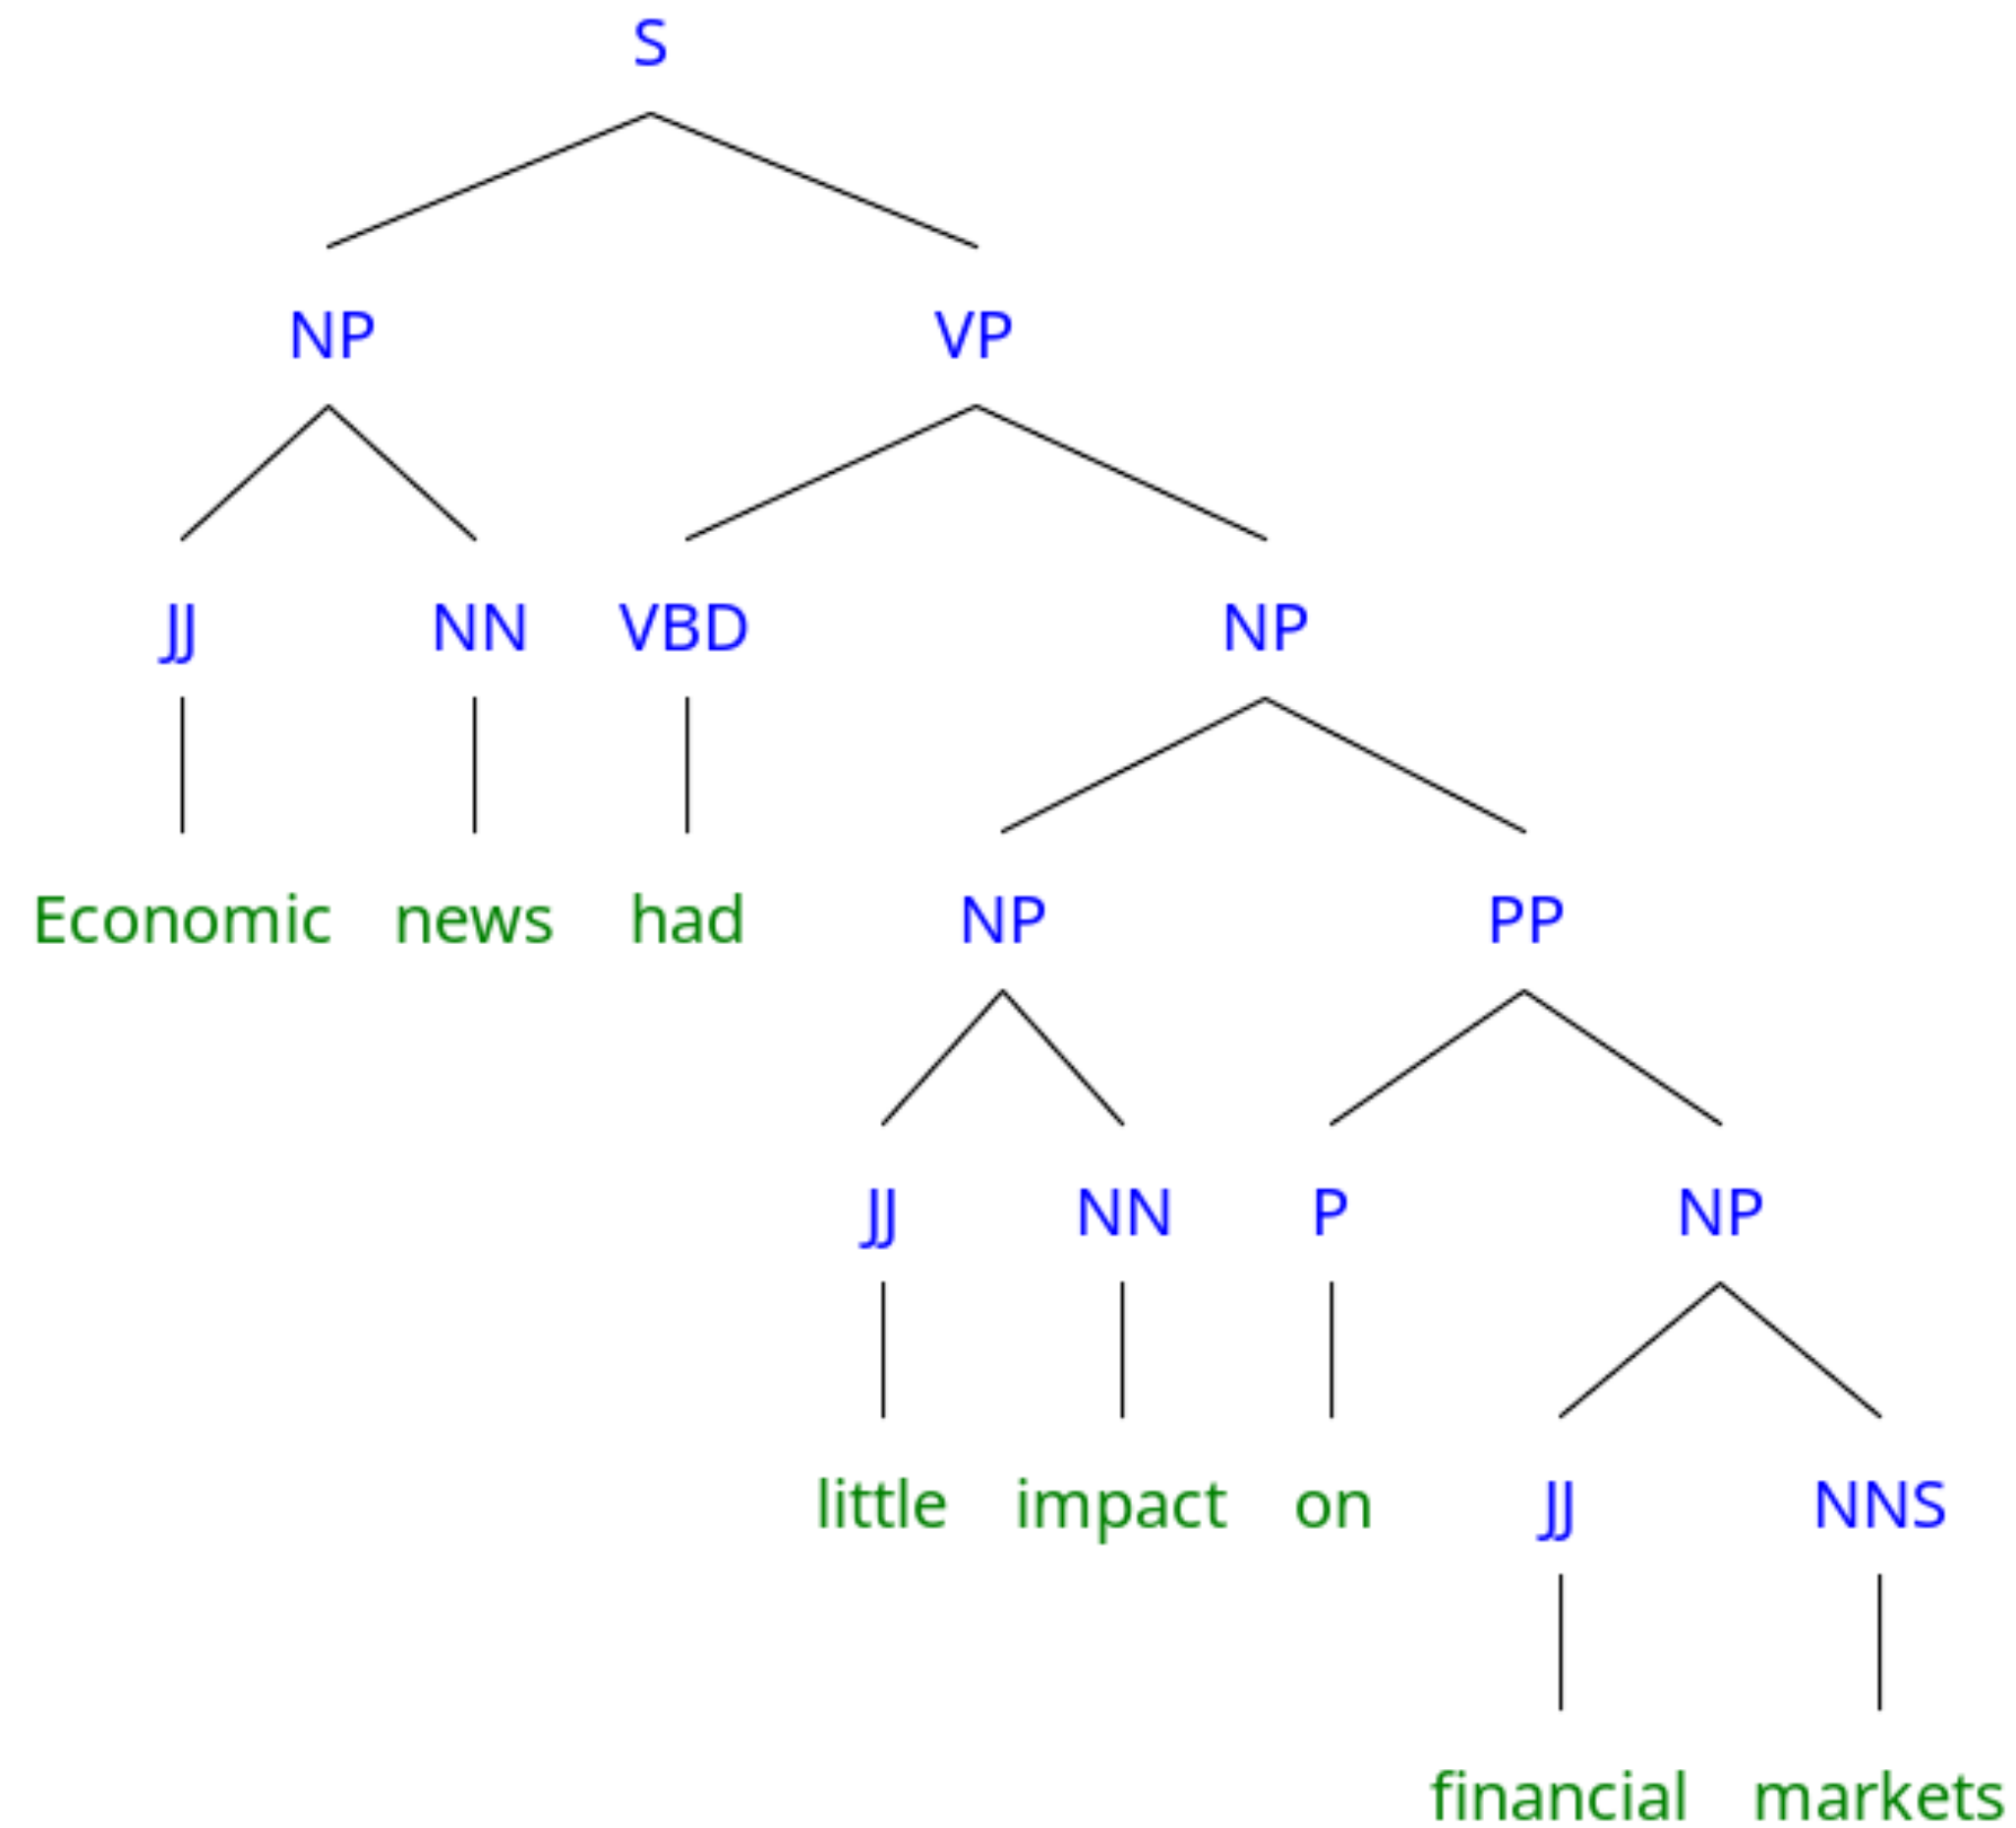

Conversion: PS \rightarrow DS

- Can convert Phrase Structure (PS) to Dependency Structure (DS)
 - ...without the dependency labels
- Algorithm:
 - Identify all head children in PS
 - Make head of each non-head-child depend on head of head-child
 - Use a *head percolation* table to determine headedness

Conversion: PS → DS

Conversion: PS → DS

had

Conversion: PS → DS

Conversion: PS → DS

Conversion: PS → DS

Conversion: PS → DS

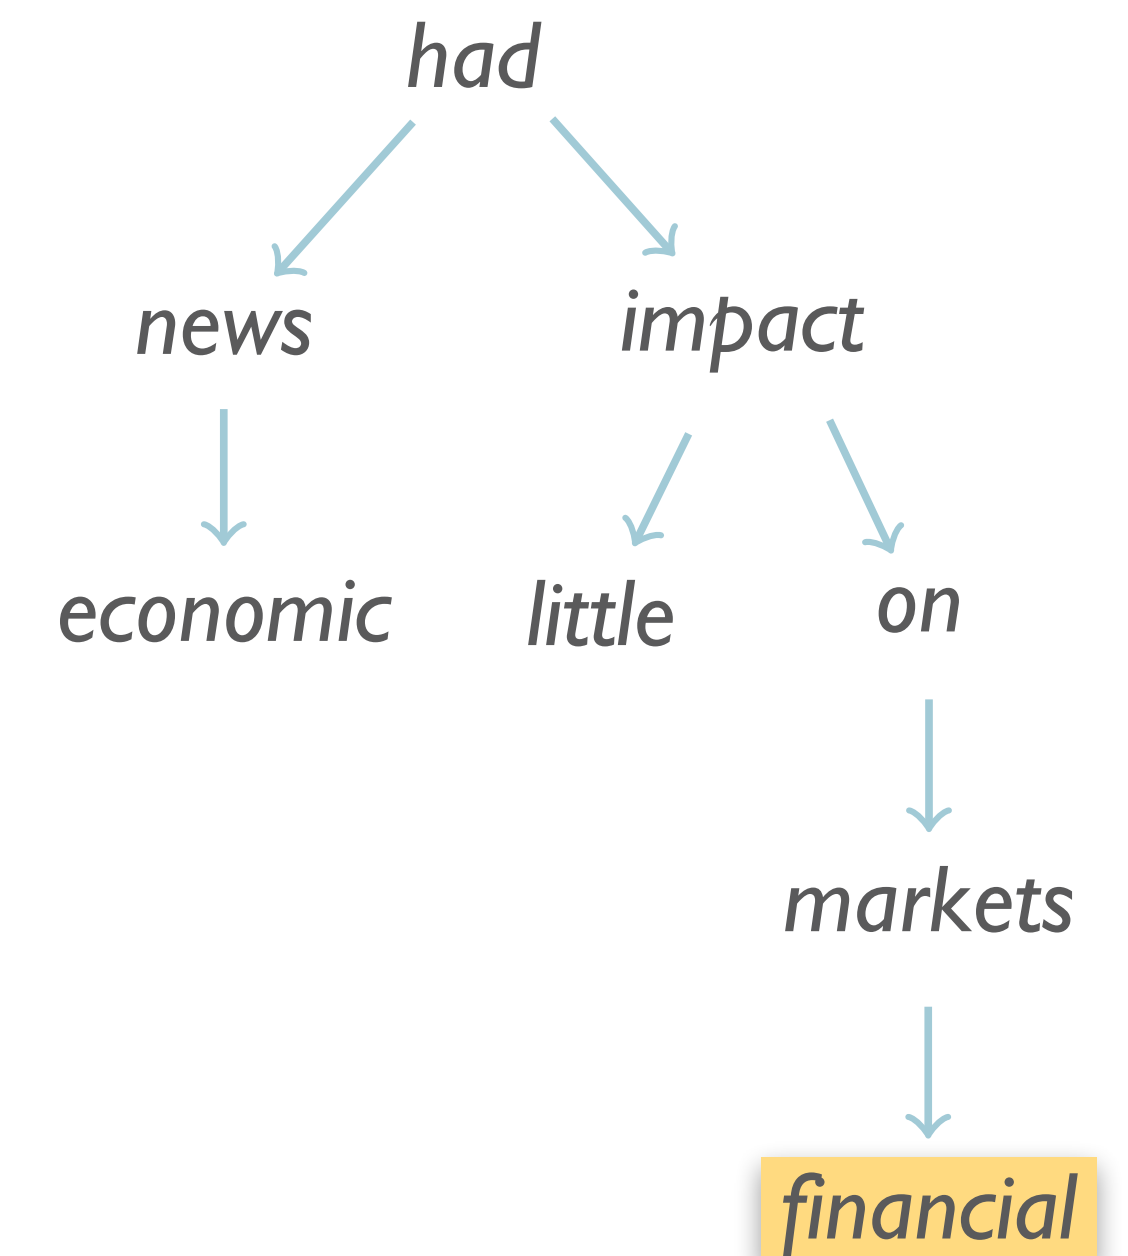

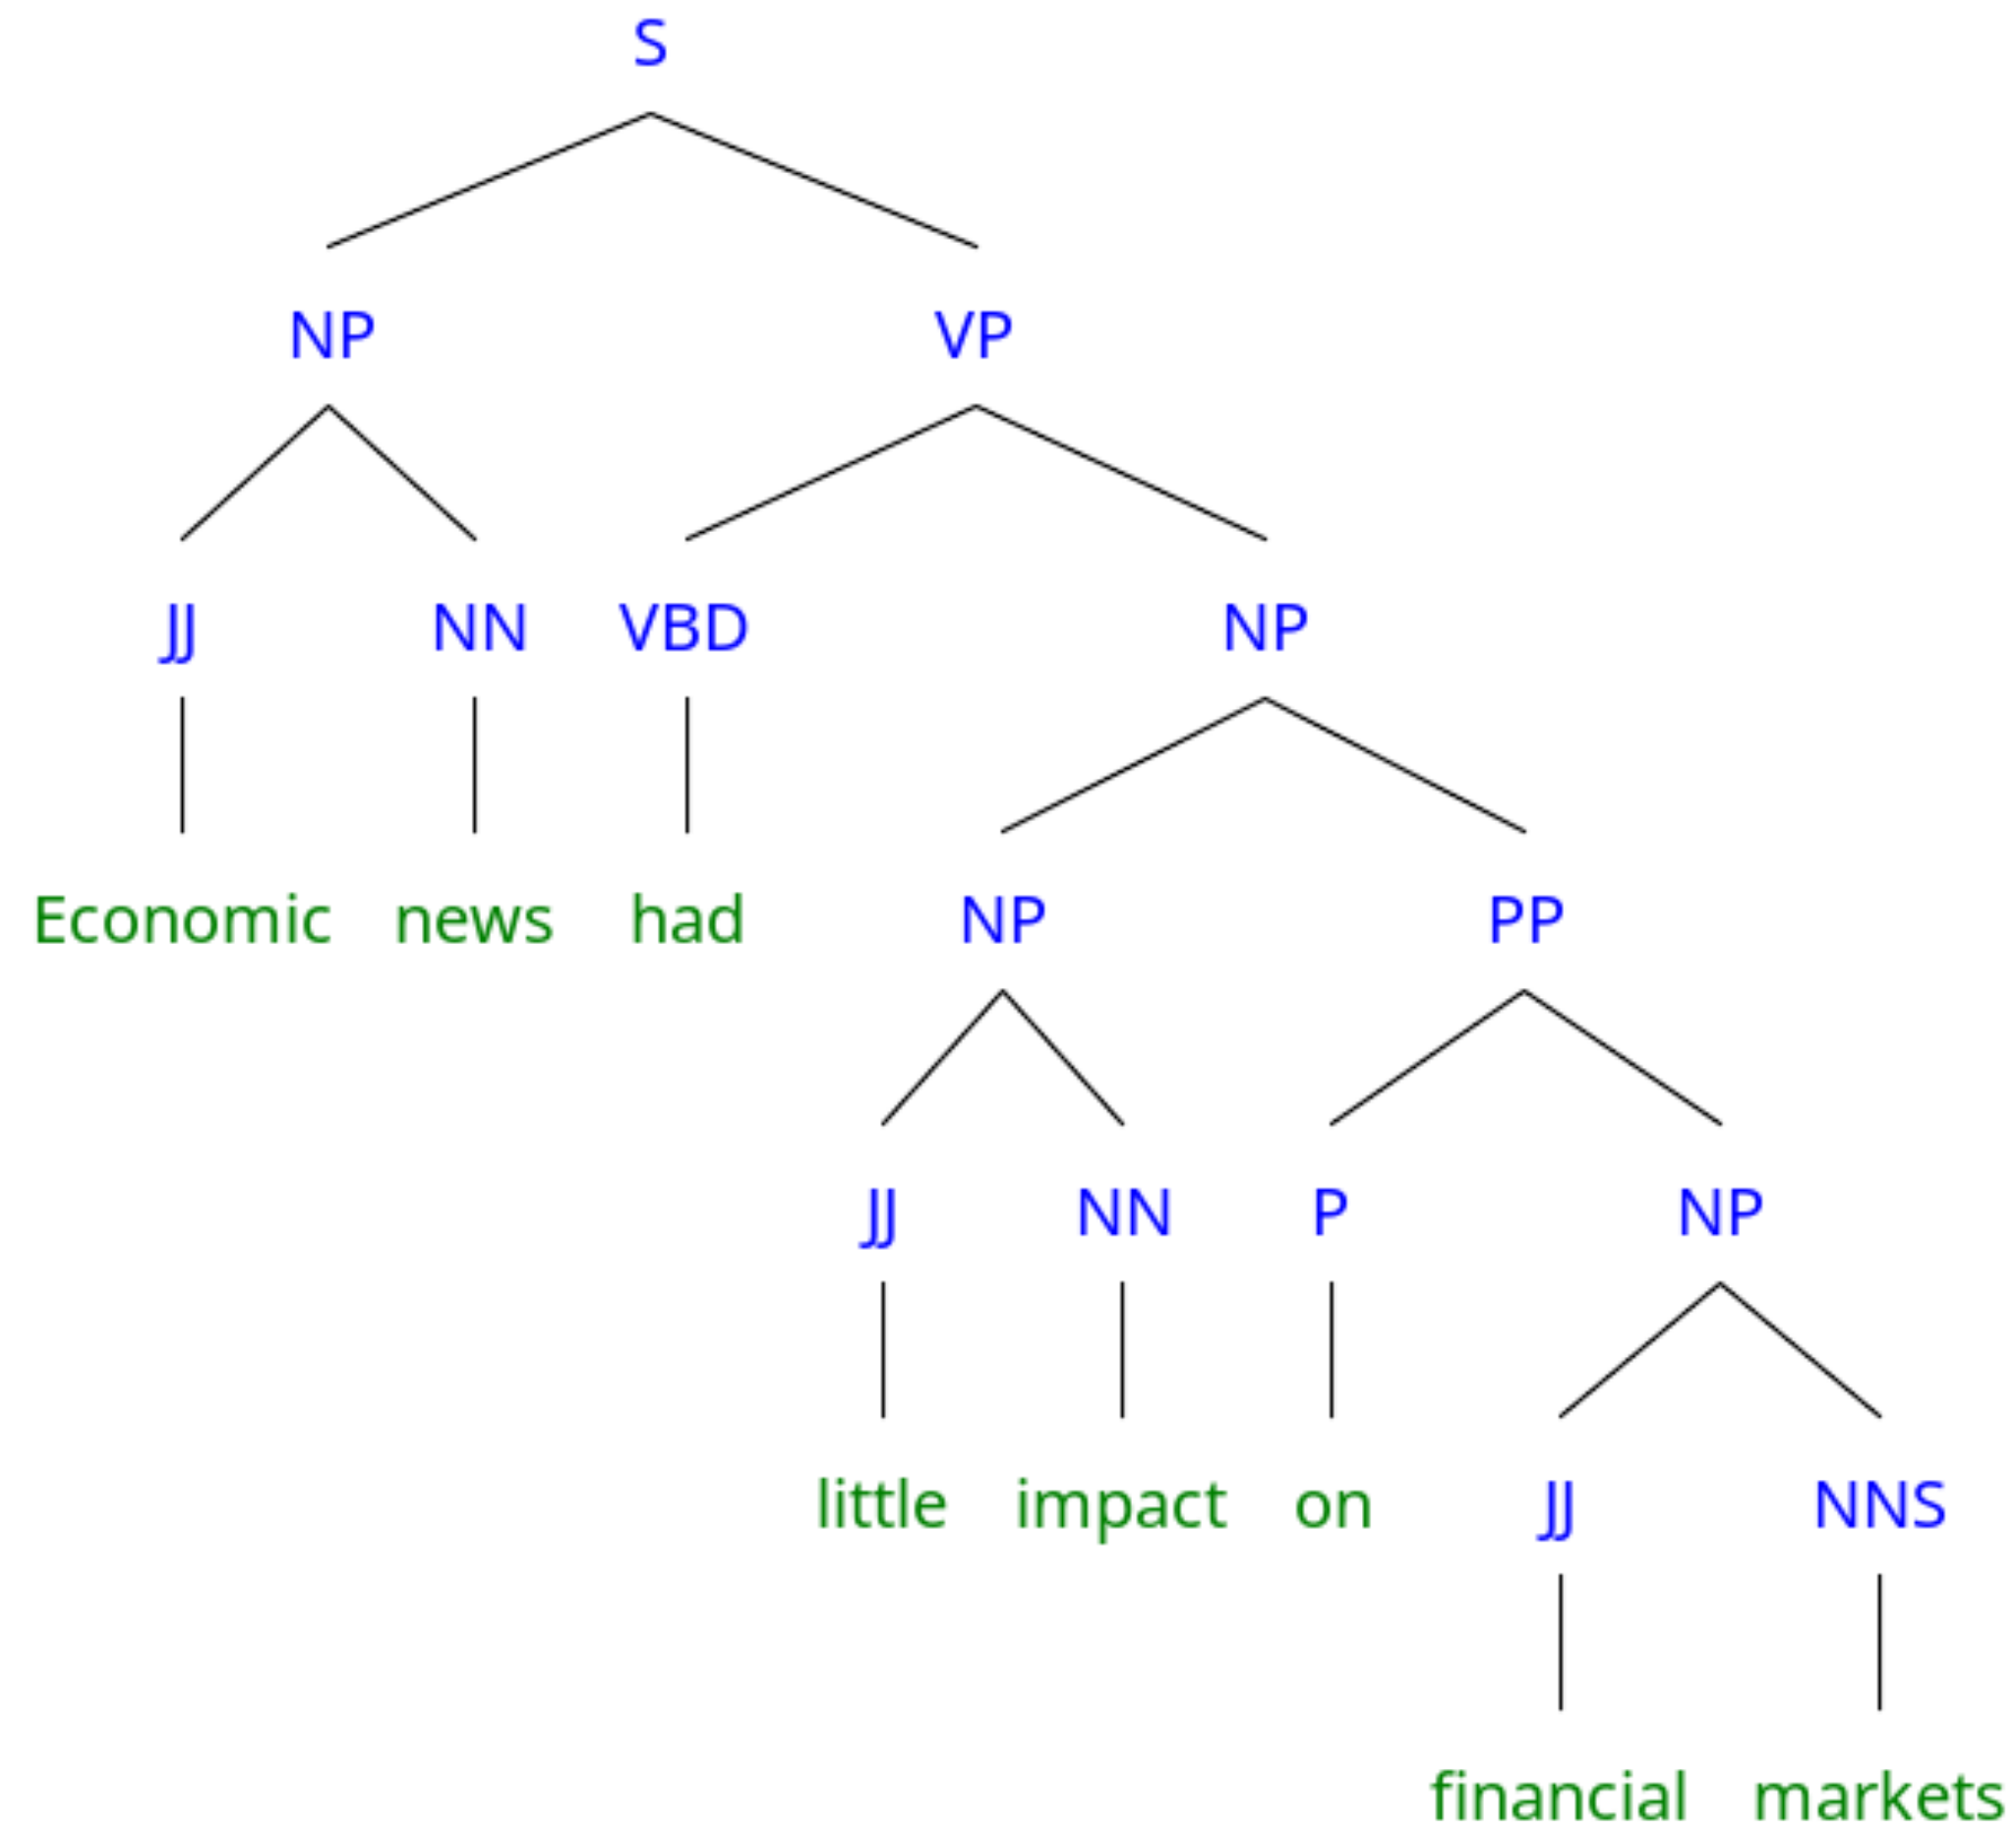

Conversion: PS → DS

Conversion: PS → DS

Conversion: PS → DS

Head Percolation Table

- Finding the head of an NP:
 - If the rightmost word is preterminal, return
 - ...else search Right→Left for first child which is *NN, NNP, NNPS*...
 - ...else search Left→Right for first child which is *NP*
 - ...else search Right→Left for first child which is *\$, ADJP, PRN*
 - ...else search Right→Left for first child which is *CD*
 - ...else search Right→Left for first child which is *JJ, JJS, RB or QP*
 - ...else return rightmost word.

From J&M Page 411, via Collins (1999)

Conversion: DS \rightarrow PS

- Can map any *projective* dependency tree to PS tree
- Projective:
 - Does not contain “crossing” dependencies w.r.t. word order

Non-Projective DS

 = *Projection*

Projective DS

 = *Projection*

More Non-Projective Parses

He is mostly not even interested in the new things and in most cases, he has no money for it either.

From [McDonald et. al, 2005](#)

Conversion: DS \rightarrow PS

- For each node w with outgoing arcs...
 - ...convert the subtree w and its dependents t_1, \dots, t_n to a new subtree:
 - Nonterminal: X_w
 - Child: w
 - Subtrees t_1, \dots, t_n in original sentence order

Conversion: DS → PS

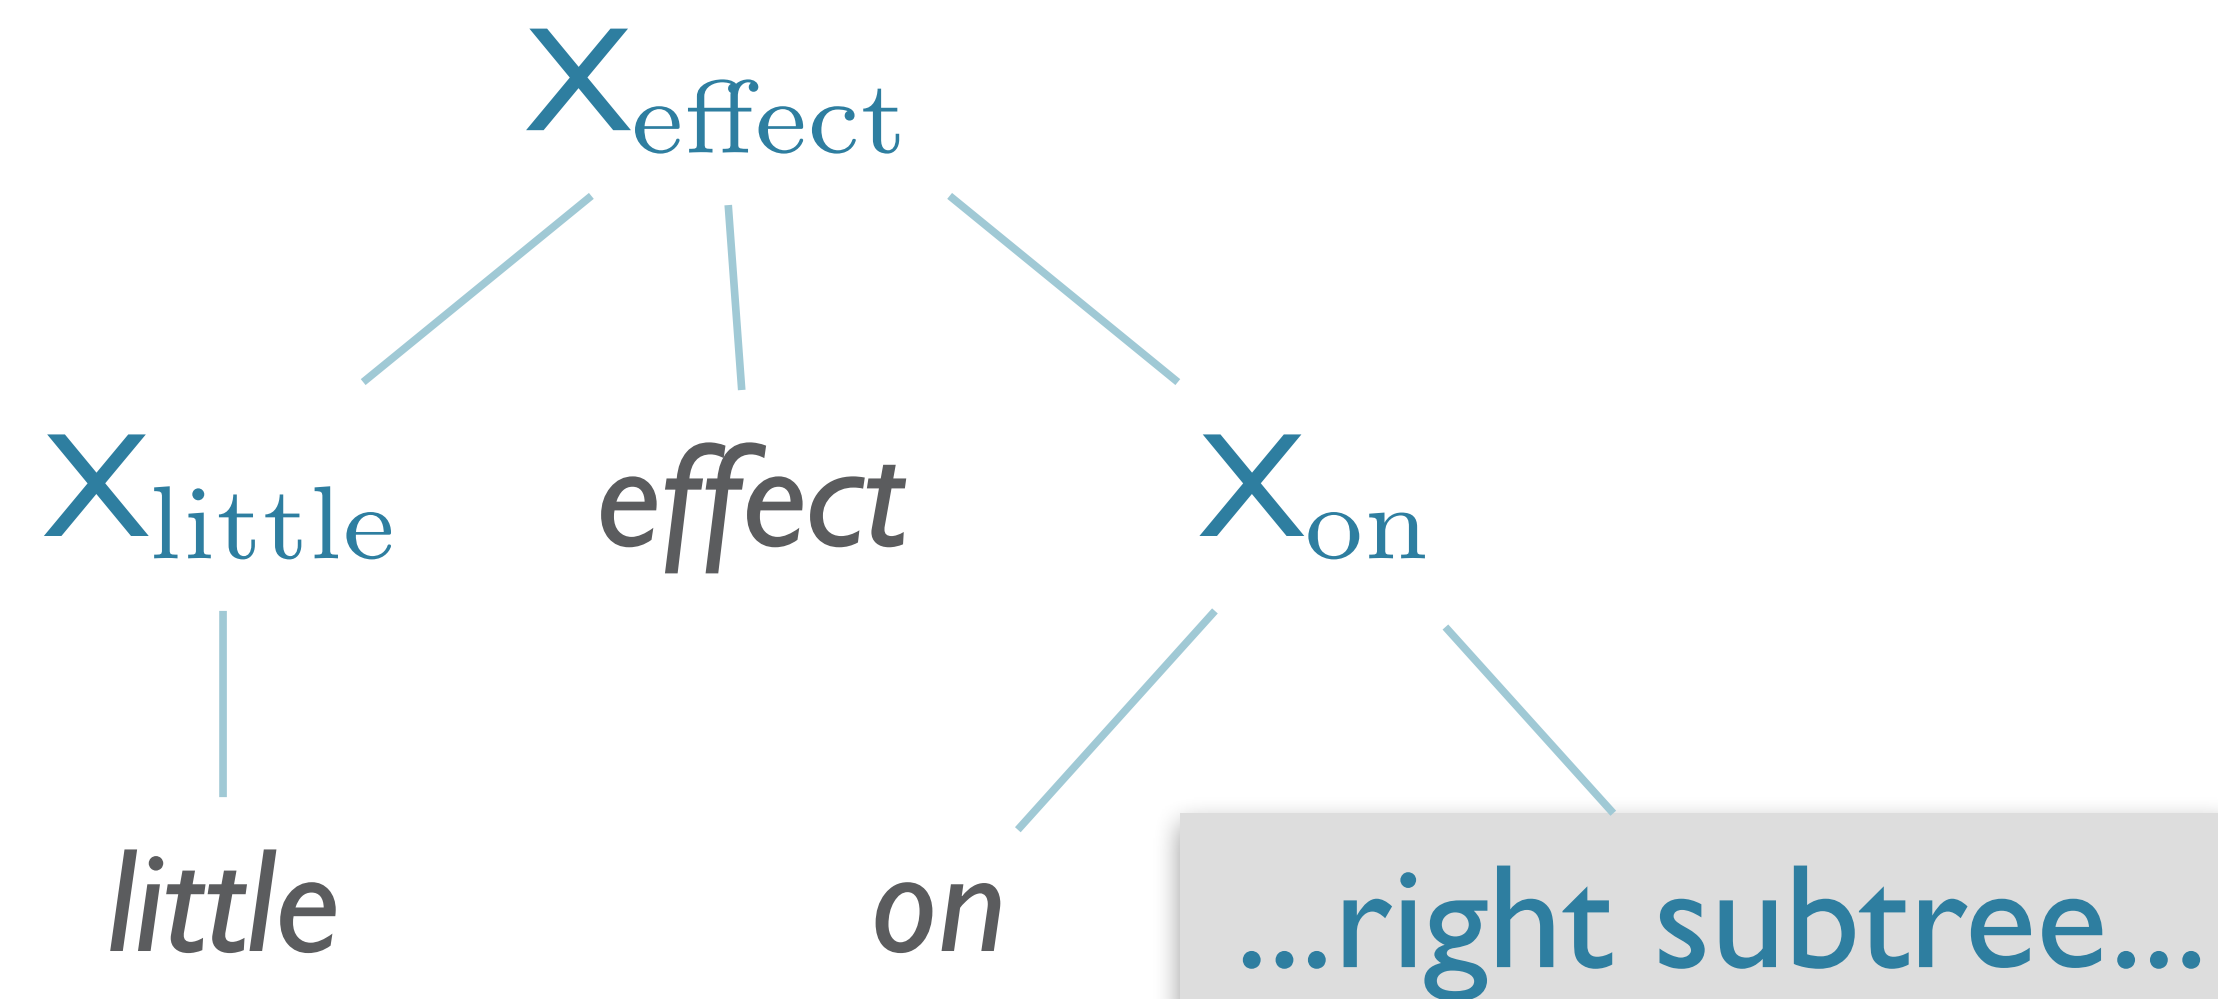

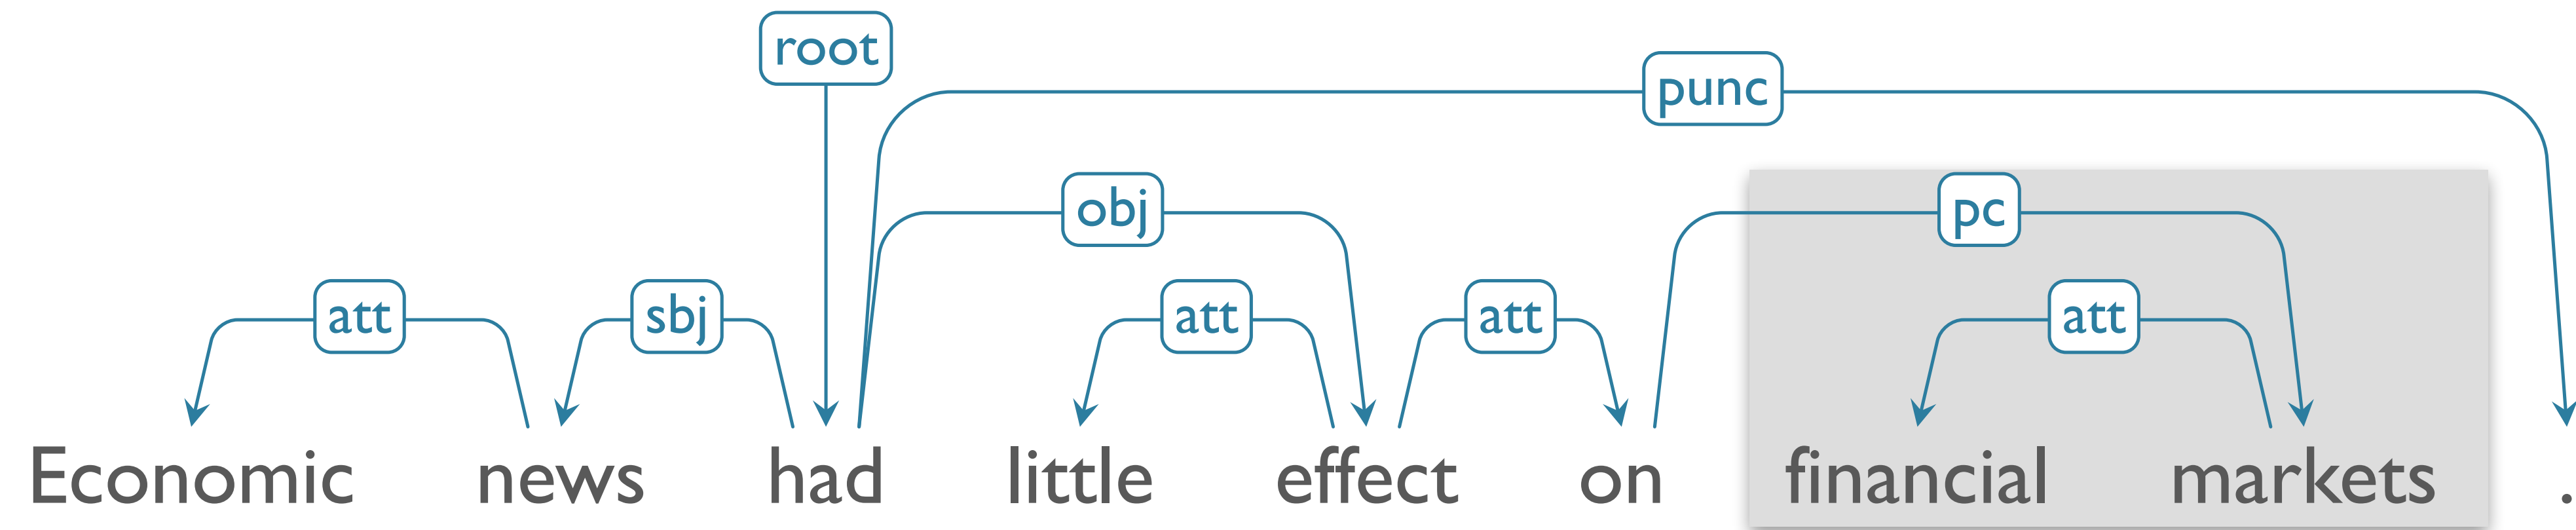

Conversion: DS → PS

Conversion: DS → PS

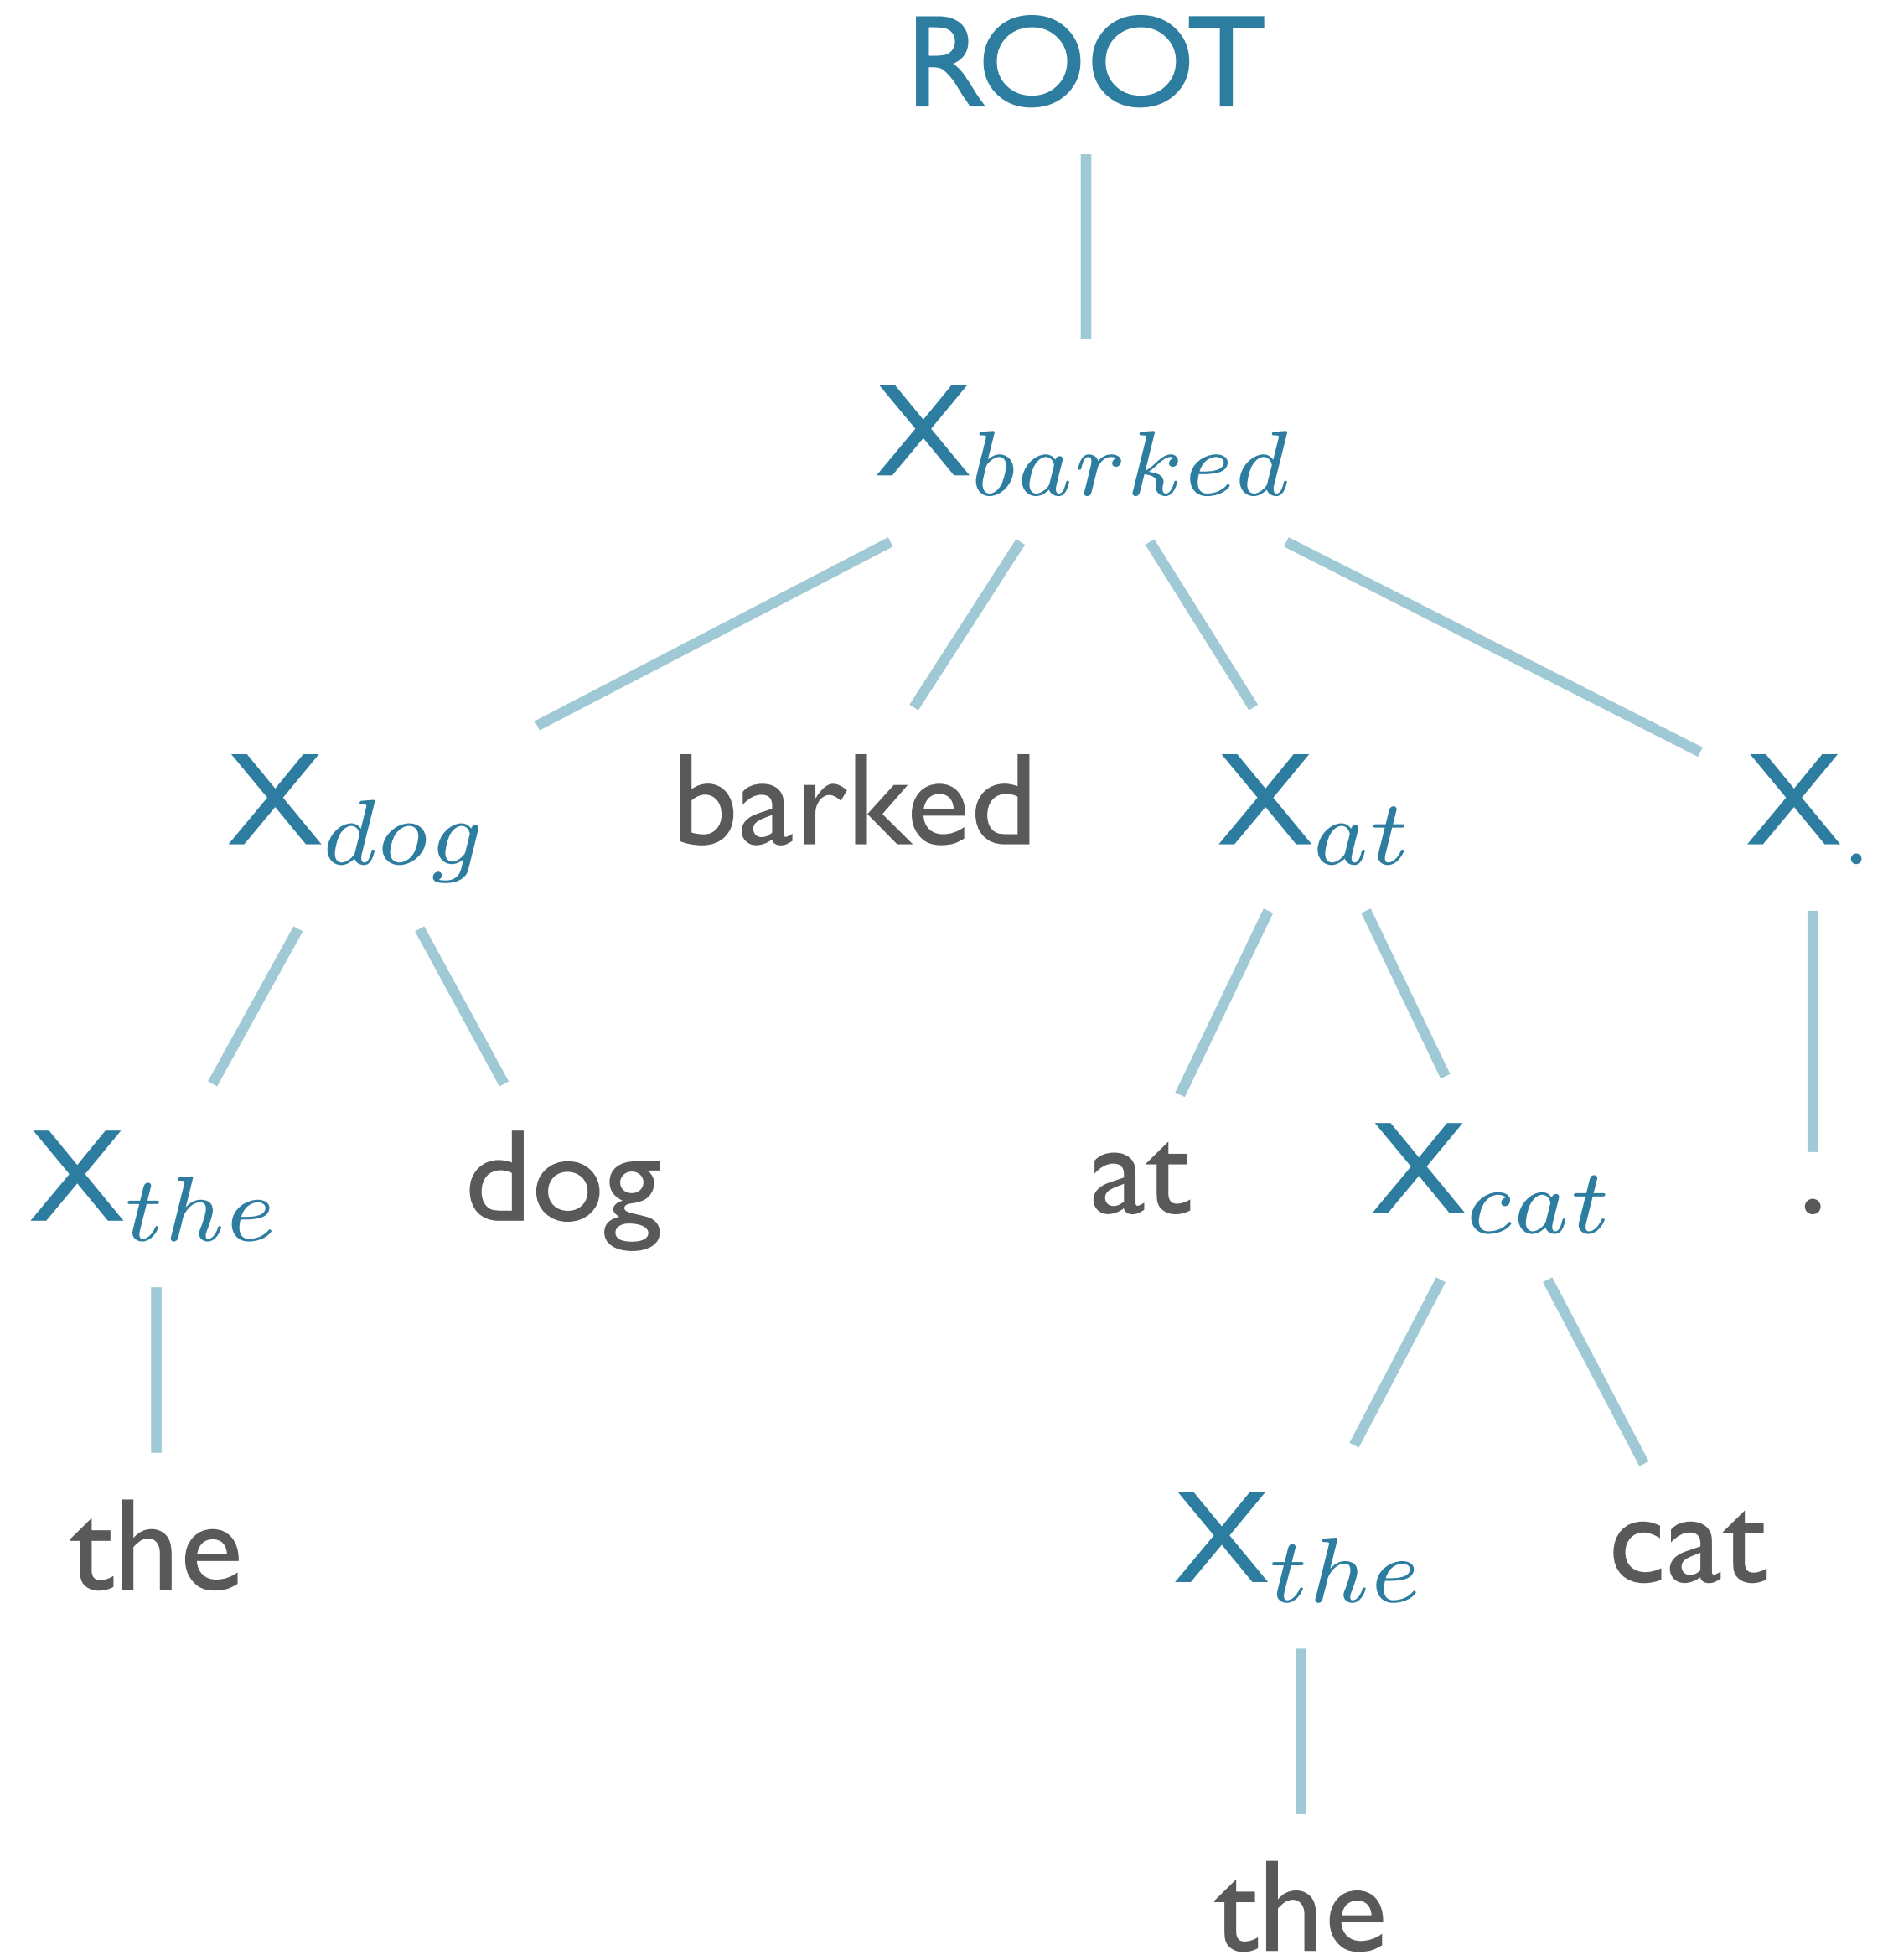

Conversion: DS → PS

Conversion: DS \rightarrow PS

- What about labeled dependencies?
 - Can attach labels to nonterminals associated with non-heads
 - e.g. $X_{little} \rightarrow X_{little:nmod}$
- Doesn't create typical PS trees
 - *Does* create fully lexicalized, labeled, context-free trees
- Can be parsed with any standard CFG parser

Example from J. Moore, 2013

Roadmap

- Dependency Grammars
 - Definition
 - Motivation:
 - Limitations of Context-Free Grammars
- **Dependency Parsing**
 - By conversion to CFG
 - **By Graph-based models**
 - By transition-based parsing

Graph-based Dependency Parsing

- Goal: Find the highest scoring dependency tree \hat{T} for sentence S
 - If S is unambiguous, T is the correct parse
 - If S is ambiguous, T is the highest scoring parse
- Where do scores come from?
 - Weights on dependency edges by learning algorithm
 - Learned from dependency treebank
- Where are the grammar rules?
 - ...there aren't any! All data-driven.

Graph-based Dependency Parsing

- Map dependency parsing to Maximum Spanning Tree (MST)
- Build fully connected initial graph:
 - Nodes: words in sentence to parse
 - Edges: directed edges between all words
 - + Edges from ROOT to all words
- Identify maximum spanning tree
 - Tree s.t. all nodes are connected
 - Select such tree with highest weight

Graph-based Dependency Parsing

- Arc-factored model:
 - Weights depend on end nodes & link
 - Weight of tree is sum of participating arcs

Initial Graph: *(McDonald et al, 2005b)*

- *John saw Mary*
 - All words connected: ROOT only has outgoing arcs
- Goal: Remove arcs to create a tree covering all words
 - Resulting tree is parse

Maximum Spanning Tree

- McDonald et al, 2005 use variant of Chu-Liu-Edmonds algorithm for MST (CLE)
- Sketch of algorithm:
 - For each node, greedily select incoming arc with max weight
 - If the resulting set of arcs forms a tree, this is the MST.
 - If not, there must be a cycle.
 - “Contract” the cycle: Treat it as a single vertex
 - Recalculate weights into/out of the new vertex
 - Recursively do MST algorithm on resulting graph
- Running time: naïve: $O(n^3)$; Tarjan: $O(n^2)$
 - Applicable to non-projective graphs

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.
- Is it a tree?

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.
- Is it a tree?
 - No, there's a cycle.

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.
- Is it a tree?
 - No, there's a cycle.
- Collapse the cycle

Step 1 & 2

- Find, for each word, the highest scoring incoming edge.
- Is it a tree?
 - No, there's a cycle.
- Collapse the cycle
- And re-examine the edges again

Calculating Weights for Collapsed Vertex

$$s(\text{Mary}, C) = 11 + 20 = 31$$

Calculating Weights for Collapsed Vertex

$$s(\text{Mary}, C) \ 11 + 20 = 31$$

Calculating Weights for Collapsed Vertex

$$s(\text{ROOT}, C) = 10 + 30 = 40$$

Calculating Weights for Collapsed Vertex

$$s(\text{ROOT}, C) \ 10 + 30 = 40$$

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge
- Is it a tree?

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge
- Is it a tree?
 - Yes!

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge
- Is it a tree?
 - **Yes!**
 - ...but must recover collapsed portions.

Step 3

- With cycle collapsed, recurse on step 1:
- Keep highest weighted incoming edge for each edge
- Is it a tree?
 - **Yes!**
 - ...but must recover collapsed portions.

MST Algorithm

function MAXSPANNINGTREE($G=(V,E)$, $root$, $score$) **returns** *spanning tree*

$F \leftarrow []$

$T' \leftarrow []$

$score' \leftarrow []$

for each $v \in V$ **do**

$bestInEdge \leftarrow \operatorname{argmax}_{e=(u,v) \in E} score[e]$

$F \leftarrow F \cup bestInEdge$

for each $e=(u,v) \in E$ **do**

$score'[e] \leftarrow score[e] - score[bestInEdge]$

if $T=(V,F)$ is a spanning tree **then return** it

else

$C \leftarrow$ a cycle in F

$G' \leftarrow \text{CONTRACT}(G, C)$

$T' \leftarrow \text{MAXSPANNINGTREE}(G', root, score')$

$T \leftarrow \text{EXPAND}(T', C)$

return T

function CONTRACT(G, C) **returns** *contracted graph*

function EXPAND(T, C) **returns** *expanded graph*

Figure 15.13 The Chu-Liu Edmonds algorithm for finding a maximum spanning tree in a weighted directed graph.

Learning Weights

- Weights for arc-factored model learned from dependency treebank
 - Weights learned for tuple (w_i, w_j, l)
- McDonald et al, 2005a employed discriminative ML
 - MIRA (Crammer and Singer, 2003)
- Operates on vector of local features

Features for Learning Weights

- Simple categorical features for (w_i, L, w_j) including:
 - Identity of w_i (or char 5-gram prefix), POS of w_i
 - Identity of w_j (or char 5-gram prefix), POS of w_j
 - Label of L , direction of L
 - Number of words between w_i, w_j
 - POS tag of w_{i-1} , POS tag of w_{i+1}
 - POS tag of w_{j-1} , POS tag of w_{j+1}
- Features conjoined with direction of attachment and distance between words

Dependency Parsing

- Dependency Grammars:
 - Compactly represent predicate–argument structure
 - Lexicalized, localized
 - Natural handling of flexible word order
- Dependency parsing:
 - Conversion to phrase structure trees
 - Graph-based parsing (MST), efficient non-proj $O(n^2)$
 - Next time: *Transition-based parsing*
