Announcements

- No class on Monday!
- HW6: grammar output does not have to exactly match your handwritten targets.
 - Be detailed in readme!

Announcements

- A note on 'or' and polymorphism (<u>Partee and Rooth 1983</u>)
 - They ate rice or they drank milk.
 - They ate rice or beans.
 - Walking or talking is their favorite thing.
 - ...
- 'or'_sentence: $\lambda p_t \lambda q_t . p \lor q$
- 'or'_IV: $\lambda v_{\langle e,t \rangle} \lambda v'_{\langle e,t \rangle} \lambda x_e$. or sentence(v(x), v'(x))

• Generally: reduce all others systematically to boolean 'or', systematically

Roadmap

- Curse of Dimensionality
- Dimensionality Reduction
 - Principle Components Analysis (PCA)
 - Singular Value Decomposition (SVD) / LSA
- Prediction-based Methods
 - CBOW / Skip-gram (word2vec)
- Word Sense Disambiguation

The Curse of Dimensionality

	tasty	delicious	disgusting	flavorful	tree
pear	0		0	0	0
apple	0	0	0		
watermelon	Ι	0	0	0	0
paw_paw	0	0		0	0
family	0	0	0	0	l

The cosine similarity for these words will be zero!

	tasty	delicious	disgusting	flavorful	tree
pear	0	Ι	0	0	0
apple	0	0	0		I
watermelon		0	0	0	0
paw_paw	0	0		0	0
family	0	0	0	0	

The cosine similarity for these words will be >0 (0.293)

	tasty	delicious	disgusting	flavorful	tree
pear	0		0	0	0
apple	0	0	0		I
watermelon		0	0	0	0
paw_paw	0	0	l	0	0
family	0	0	0	0	

	tasty	delicious	disgusting	flavorful	tree
pear	0		0	0	0
apple	0	0	0		
watermelon	I	0	0	0	0
paw_paw	0	0		0	0
family	0	0	0	0	

But if we could collapse all of these into one "meta-dimension"...

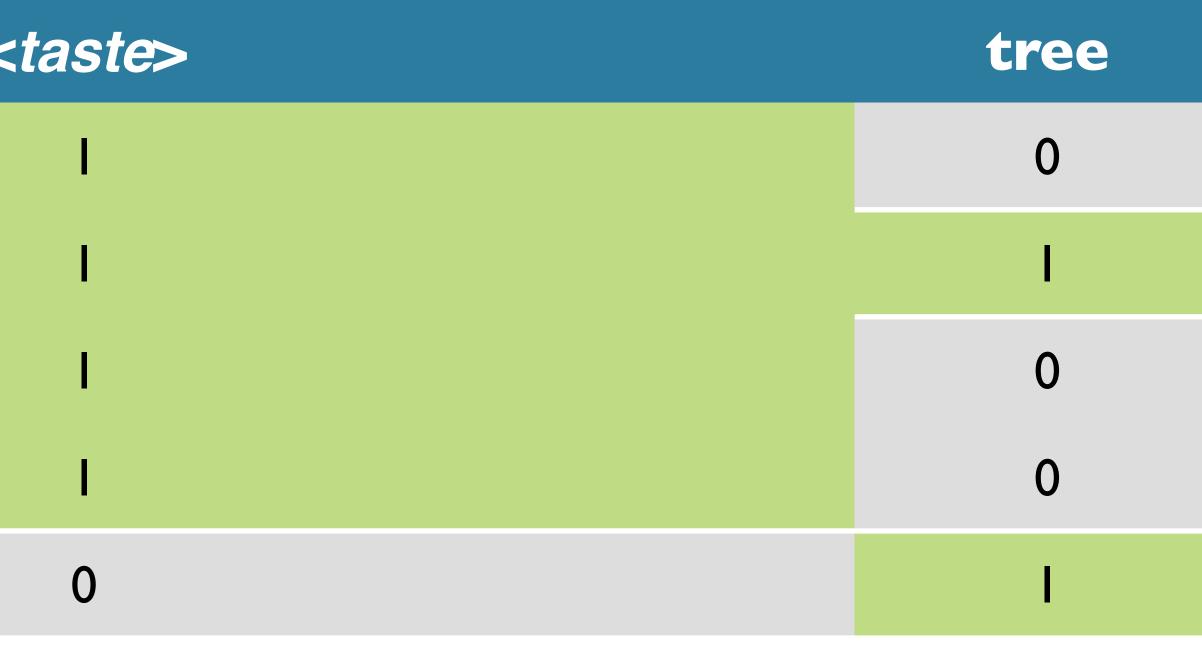

pear	
apple	
watermelon	
paw_paw	
family	

Now, these things have "taste" associated with them as a concept

Curse of Dimensionality

- Vector representations are sparse, very high dimensional
 - # of words in vocabulary
 - # of relations × # words, etc

1

Curse of Dimensionality

- Vector representations are sparse, very high dimensional
 - # of words in vocabulary
 - # of relations × # words, etc
- <u>Google 1T 5-gram corpus</u>:
 - In bigram 1M × 1M matrix: < 0.05% non-zero values

1

Curse of Dimensionality

- Vector representations are sparse, very high dimensional
 - # of words in vocabulary
 - # of relations × # words, etc
- <u>Google 1T 5-gram corpus</u>:
 - In bigram 1M × 1M matrix: < 0.05% non-zero values
- Computationally hard to manage
 - Lots of zeroes
 - Can miss underlying relations

1

Roadmap

- Curse of Dimensionality
- Dimensionality Reduction
 - Principle Components Analysis (PCA)
 - Singular Value Decomposition (SVD) / LSA
- Prediction-based Methods
 - CBOW / Skip-gram (word2vec)
- Word Sense Disambiguation

• Can we use *fewer* features to build our matrices?

- Can we use *fewer* features to build our matrices?
- Ideally with
 - **High** frequency means fewer zeroes in our matrix
 - High variance larger spread over values makes items easier to separate

- One approach *filter* out features
 - Can exclude terms with too few occurrences
 - Can include only top X most frequently seen features
 - χ^2 selection

- Things to watch out for:
 - Feature correlation if features strongly correlated, give redundant information
 - Joint feature selection complex, computationally expensive

- Approaches to project into lower-dimensional spaces
 - Principal Components Analysis (PCA)
 - Locality Preserving Projections (LPP) [link]
 - Singular Value Decomposition (SVD)

- All approaches create new lower dimensional space that
 - Preserves distances between data points
 - (Keep like with like)

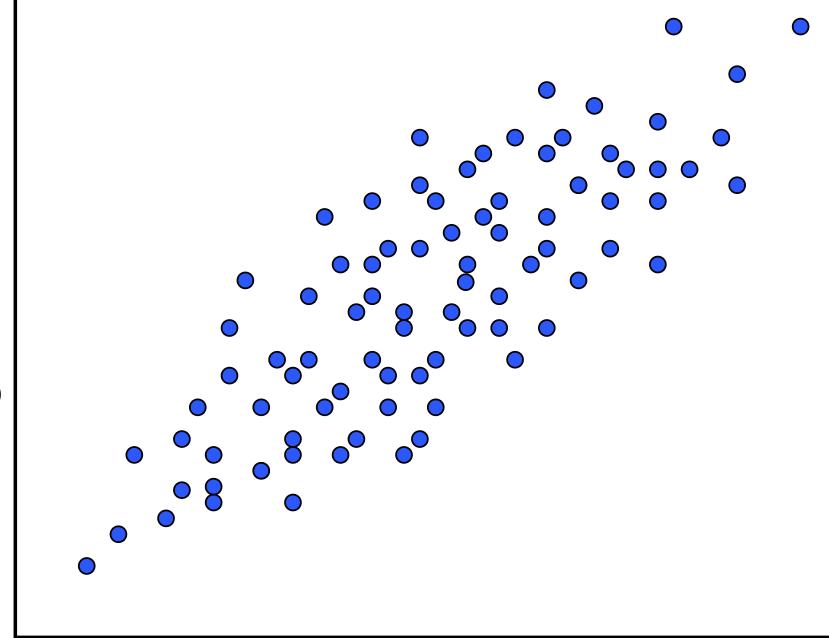

- All approaches create new lower dimensional space that
 - Preserves distances between data points
 - (Keep like with like)
- Approaches differ on exactly what is preserved

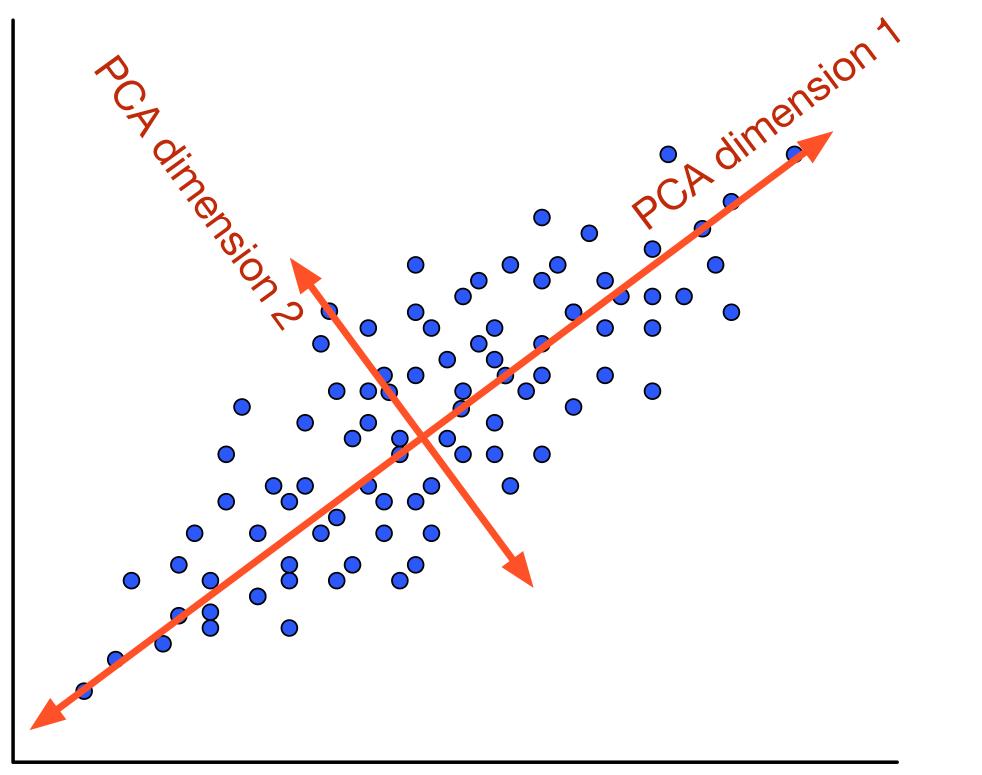

Original Dimension 2

Original Dimension 1

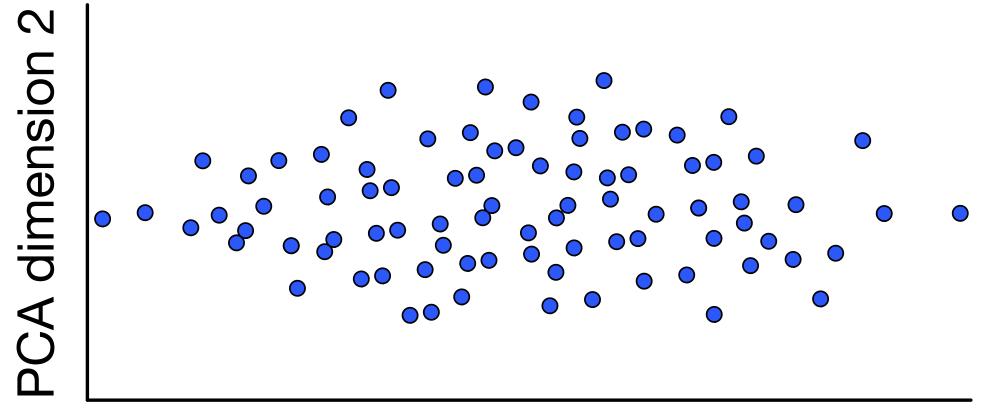

N **Original Dimension**

Original Dimension 1

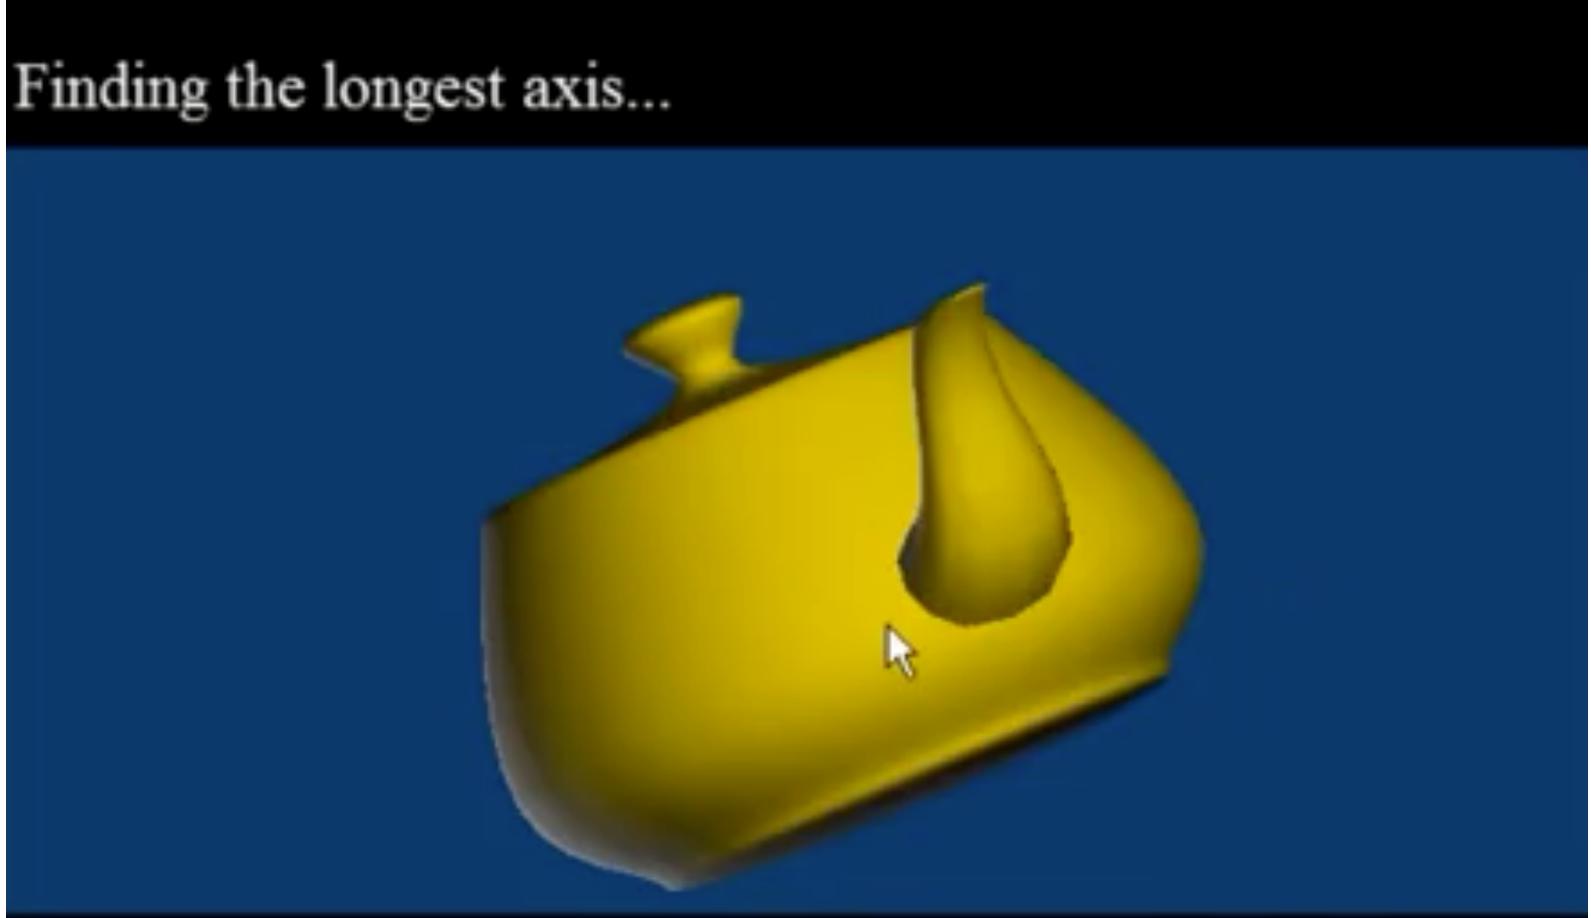

PCA dimension 1

 \bigcirc

PCA dimension 1

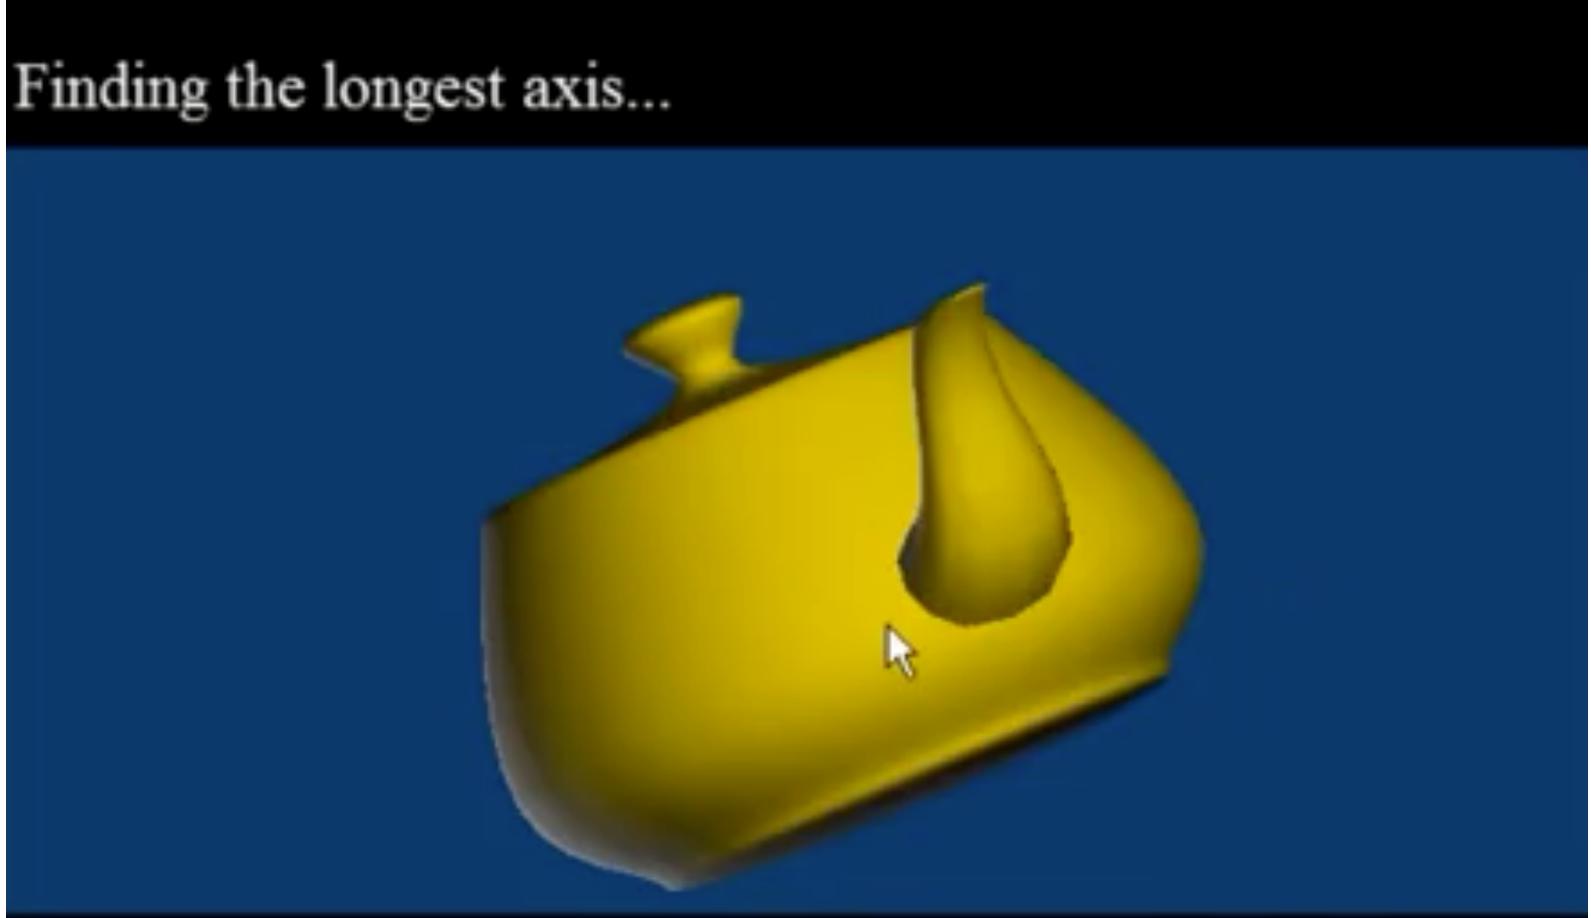

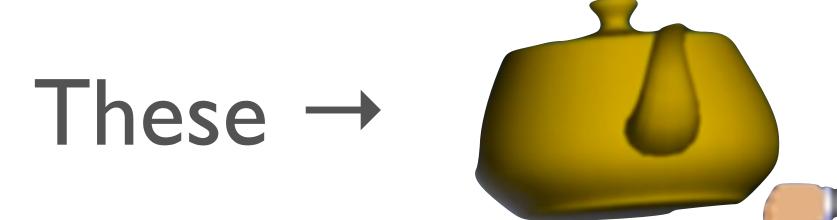

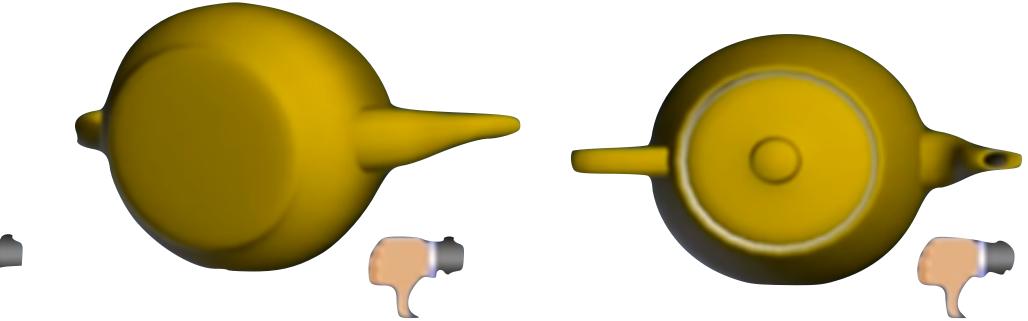

Preserves more information than

via [<u>A layman's introduction to PCA</u>]

PCA for Word Vectors

- Take |V| x N matrix of word-vectors
- Apply PCA to get new |V| x N matrix
 - Truncate to |V| x m matrix, for some choice of m < N
- Even with other methods discussed later, very useful for 2/3-D visualization

SVD and LSA

Singular Value Decomposition (SVD)

- Enables creation of reduced dimension model
 - Low rank approximation of of original matrix
 - Best-fit at that rank (in least-squares sense)

Singular Value Decomposition (SVD)

- Original matrix: high dimensional, sparse
 - Similarities missed due to word choice, etc
- Create new, projected space
 - More compact, better captures important variation
- Landauer et al (1998) argue identifies underlying "concepts"
 - Across words with related meanings

Latent Semantic Analysis (LSA)

- Apply SVD to IVI × c term-document matrix X
 - $V \rightarrow$ Vocabulary
 - $c \rightarrow$ documents
 - X
 - $row \rightarrow word$
 - $column \rightarrow document$
 - $cell \rightarrow count of word/document$

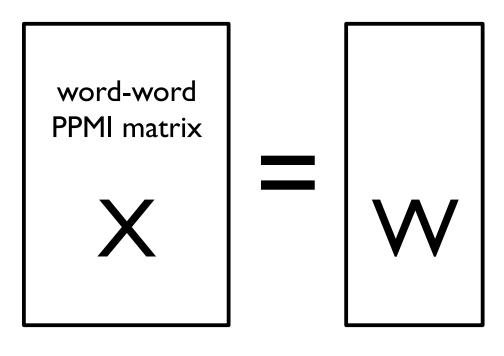

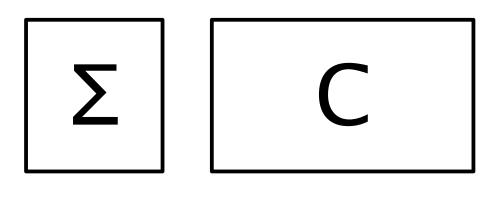

Latent Semantic Analysis (LSA)

- Factor X into three new matrices:
 - $W \rightarrow$ one row per word, but columns are now arbitrary **m** dimensions
 - $\Sigma \rightarrow$ Diagonal matrix, where every (1,1) (2,2) etc... is the rank for **m**
 - $C^{T} \rightarrow$ arbitrary **m** dimensions, as spread across c documents

Prediction-Based Models

Prediction-based Embeddings

• Dimensionality reduction models: good, but expensive to compute

Prediction-based Embeddings

- Skip-gram and Continuous Bag of Words (CBOW) models

• Dimensionality reduction models: good, but expensive to compute

Prediction-based Embeddings

- Dimensionality reduction models: good, but expensive to compute
- Skip-gram and Continuous Bag of Words (CBOW) models
- Intuition:
 - Words with similar meanings share similar contexts
 - Train models to learn to predict context words
 - Models train embeddings that make current word more like nearby words and less like distance words
 - Provably related to PPMI models under SVD

Embeddings: Skip-Gram vs. Continuous Bag of Words

- Continuous Bag of Words (CBOW):
 - P(word|context)
 - Input: $(W_{t-1}, W_{t-2}, W_{t+1}, W_{t+2} \dots)$
 - Output: $p(W_t)$

Embeddings: Skip-Gram vs. Continuous Bag of Words

- Continuous Bag of Words (CBOW):
 - P(word context)
 - Input: $(W_{t-1}, W_{t-2}, W_{t+1}, W_{t+2}...)$
 - Output: $p(W_t)$
- Skip-gram:
 - P(context|word)
 - Input: *W*_t
 - Output: $p(W_{t-1}, W_{t-2}, W_{t+1}, W_{t+2}...)$

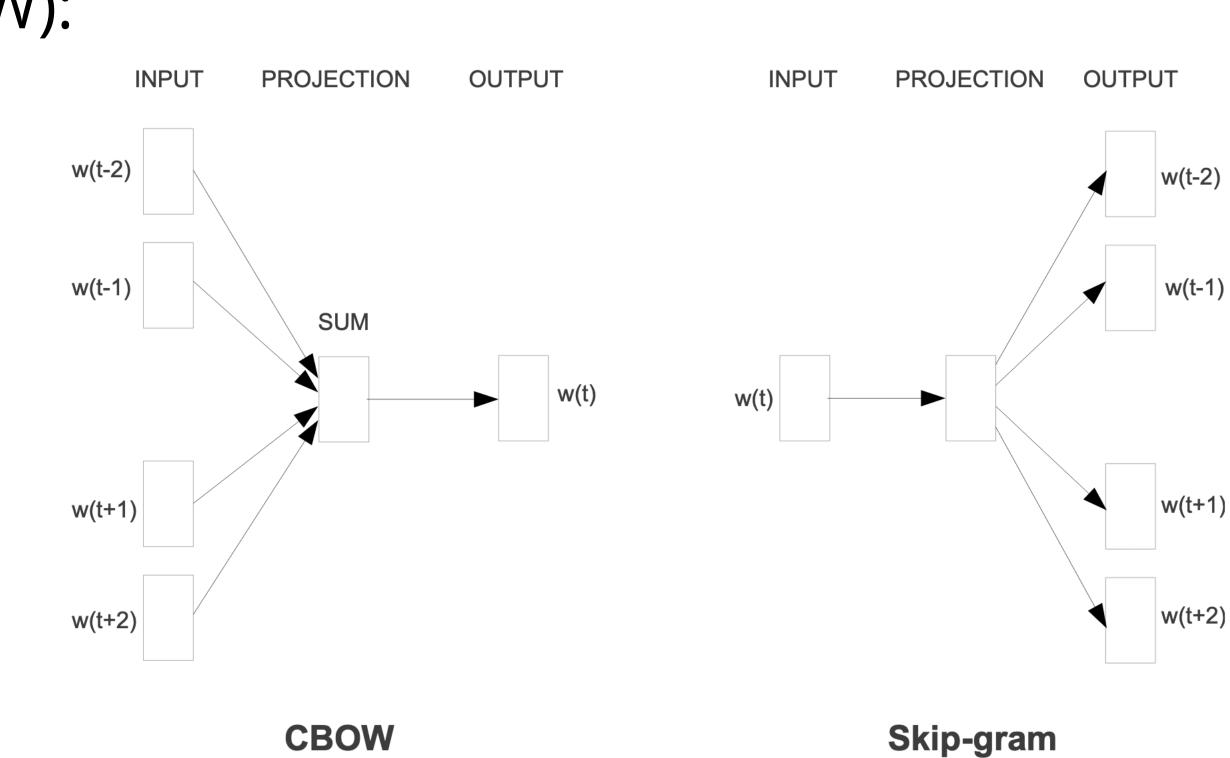

Embeddings: Skip-Gram vs. Continuous Bag of Words

- Continuous Bag of Words (CBOW):
 - P(word|context)
 - Input: $(W_{t-1}, W_{t-2}, W_{t+1}, W_{t+2}...)$
 - Output: $p(W_t)$
- Skip-gram:
 - P(context|word)
 - Input: *W*^t
 - Output: $p(W_{t-1}, W_{t-2}, W_{t+1}, W_{t+2}...)$

<u>Mikolov et al 2013a</u> (the OG word2vec paper)

W UNIVERSITY of WASHINGTON

Skip-Gram Model

- Learns two embeddings
 - W: word, matrix of shape [vocab_size, embedding_dimension]
 - C: context embedding, matrix of same shape

$$p(w_k | w_j) = \frac{e^{\mathbf{C}_k \cdot \mathbf{W}_j}}{\sum_i e^{\mathbf{C}_i \cdot \mathbf{W}_j}}$$

Skip-Gram Model

- Learns two embeddings
 - W: word, matrix of shape [vocab_size, embedding_dimension] • C: context embedding, matrix of same shape
- Prediction task:
 - Given a word, predict each neighbor word in window $p(w_k | w_j) = \frac{e^{\mathbf{C}_k \cdot \mathbf{W}_j}}{\sum_i e^{\mathbf{C}_i \cdot \mathbf{W}_j}}$ • Compute $p(w_k | w_j)$ as proportional to $c_k \cdot w_j$ • For each context position

 - Convert to probability via softmax

Training The Model

- Approach:
 - Randomly initialize W, C
 - Iterate over corpus, update w/ stochastic gradient descent
 - Update embeddings to improve loss function
- Use trained embeddings directly as word representations

Training The Model

- Issue:
 - Denominator computation is very expensive $p(w_k | w_j) = \frac{\mathbf{C}_k \cdot \mathbf{W}_j}{\sum_i \mathbf{C}_i \cdot \mathbf{W}_i}$ Approximate by negative sampling (efficient approximation to Noise)
- Strategy:
 - **Contrastive Estimation):**
 - + example: true context word
 - – example: *k* other words, sampled

W UNIVERSITY of WASHINGTON 47

Negative Sampling, Idea

- Skip-Gram:
 - $P(w_k | w_j)$: what is the probability that w_k occurred in the context of w_j
 - Classifier with |V| classes
- Negative sampling:
 - $P(+|w_k, w_j)$: what is the probability that (w_k, w_j) was a true co-occurrence?
 - $P(-|w_k, w_j) = 1 P(+|w_k, w_j)$

 - Probability that (w_k, w_j) was not a true co-occurrence • Examples of "fake" co-occurrences = *negative samples*
 - Binary classifier

Generating Positive Examples

... lemon, a [tablespoon of apricot jam, a] pinch ... c1 c2 w c3

positive examples +

W

apricot of

apricot a

c4

 $c_{\rm pos}$

Generating Positive Examples

• Iterate through the corpus. For each word: add all words within a *window_size* of the current word as a positive pair.

- ... lemon, a [tablespoon of apricot jam, a] pinch ... c1 c2 w c3 c4

 - W
 - apricot of
 - apricot jam
 - apricot a

positive examples +

 $c_{\rm pos}$

apricot tablespoon

Generating Positive Examples

- Iterate through the corpus. For each word: add all words within a *window_size* of the current word as a positive pair.
 - NB: *window_size* is a hyper-parameter
 - ... lemon, a [tablespoon of apricot jam, a] pinch ... c2 w c3 c1 c4

 - W
 - apricot of
 - apricot a

positive examples +

 $c_{\rm pos}$

- apricot tablespoon
- apricot jam

Negative Samples

- For each positive (w, c) sample, generate *num_negatives* samples
 - (w, c'), where c' is different from c
 - NB: *num_negatives* is a hyper-parameter

negative examples -

W	cneg	W	cneg
apricot	aardvark	apricot	seven
apricot	my	apricot	forever
apricot	where	apricot	dear
apricot	coaxial	apricot	if

Negative Samples, up-weighting

- It's also common to "upsample" less frequent words
- Instead of sampling from raw frequencies from the corpus, raise them to a power to "flatten" the distribution

$$P_{\alpha}(w) = \overline{\underline{S}}$$

 $\frac{count(w)^{\alpha}}{\sum_{w'} count(w')^{\alpha}}$

The Data, Summary

- X = pairs of words
- $Y = \{0, 1\}$
 - 1 = + (positive example), 0 = (negative example)
- Example (x, y) pairs:
 - ("apricot", "tablespoon"), 1)
 - (("apricot", "jam"), 1)
 - (("apricot", "aardvark"), 0)
 - (("apricot", "my"), 0)

- So what is P(1 | w, c) (more specifically, $P(1 | w, c; \theta)$)?
- As before, learns two embeddings
 - W: word, matrix of shape [vocab_size, embedding_dimension]
 - W_{w} : embedding for word w [row of the matrix]
 - C: context embedding, matrix of same shape

One More Example

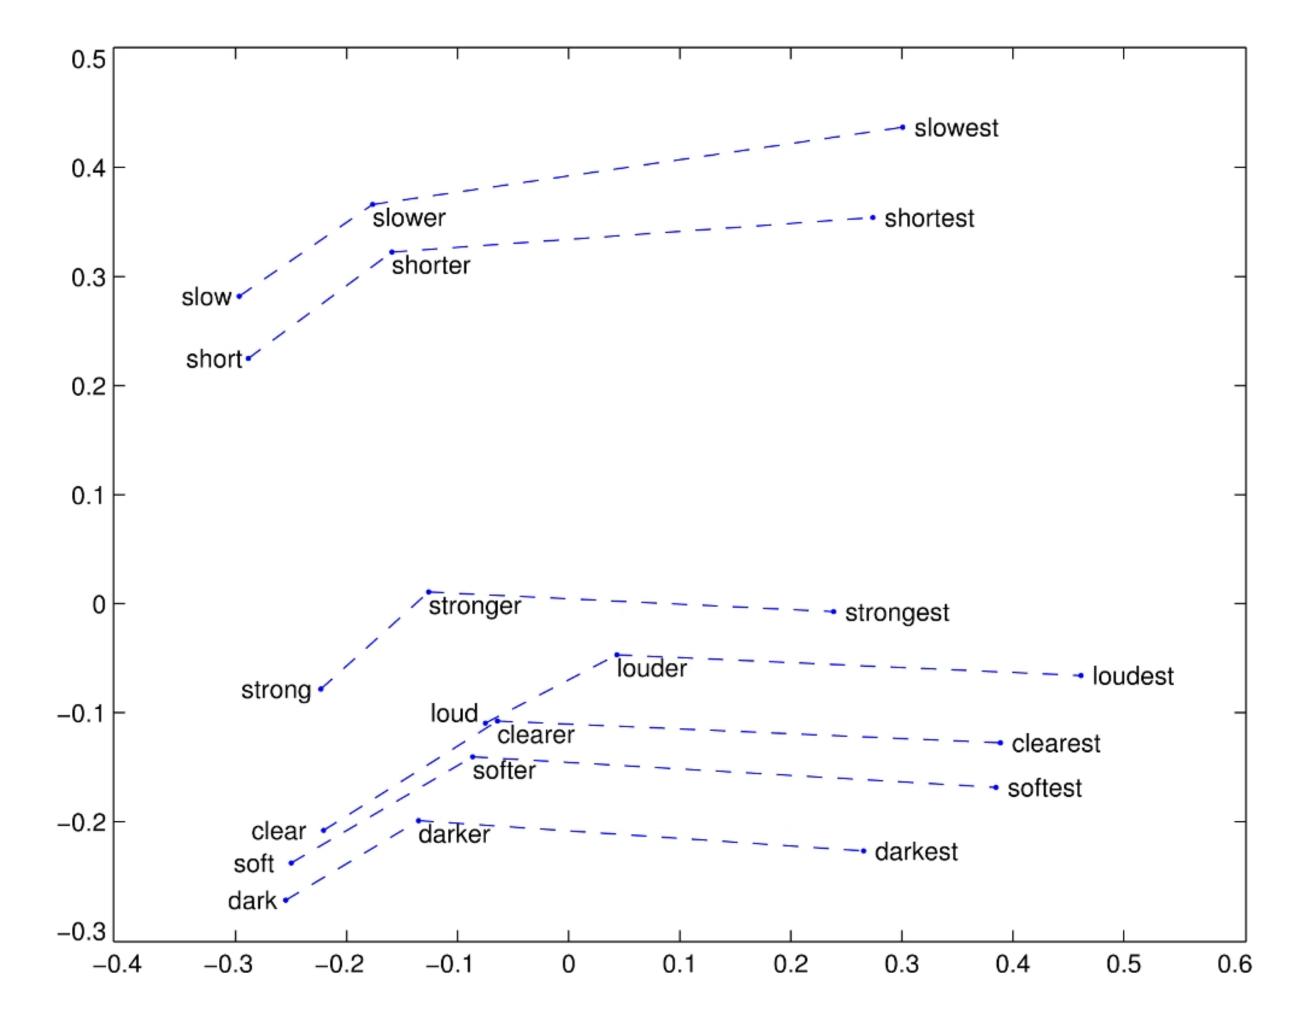

what a capital city means.

Figure 2: Two-dimensional PCA projection of the 1000-dimensional Skip-gram vectors of countries and their capital cities. The figure illustrates ability of the model to automatically organize concepts and learn implicitly the relationships between them, as during the training we did not provide any supervised information about Mikolov et al 2013c

One More Example

Caveat Emptor

Abstract

The offset method for solving word analogies has become a standard evaluation tool for vector-space semantic models: it is considered desirable for a space to represent semantic relations as consistent vector offsets. We show that the method's reliance on cosine similarity conflates offset consistency with largely irrelevant neighborhood structure, and propose simple baselines that should be used to improve the utility of the method in vector space evaluation.

Issues in evaluating semantic spaces using word analogies

Power of Prediction-based Embeddings

- Count-based embeddings:
 - Very high-dimensional (|V|)
 - Sparse
 - Pro: features are interpretable ["occurred with word W N times in corpus"]
- Prediction-based embeddings:
 - "Low"-dimensional (typically ~300-1200)
 - Dense
 - Con: features are not immediately interpretable
 - i.e. what does "dimension 36 has value -9.63" mean?

- Unsupervised POS tagging
- Word Sense Disambiguation
- Essay Scoring
- Document Retrieval
- Unsupervised Thesaurus Induction
- Ontology/Taxonomy Expansion
- Analogy Tests, Word Tests
- Topic Segmentation

Diverse Applications

General Recipe

General Recipe

- Embedding layer (~300-dimensions):
 - download pre-trained embeddings

Ethical Issues Around Embeddings

text also learn our biases

Man is to Computer Programmer as Woman is to **Homemaker? Debiasing Word Embeddings**

Tolga Bolukbasi¹, Kai-Wei Chang², James Zou², Venkatesh Saligrama^{1,2}, Adam Kalai² ¹Boston University, 8 Saint Mary's Street, Boston, MA ²Microsoft Research New England, 1 Memorial Drive, Cambridge, MA tolgab@bu.edu, kw@kwchang.net, jamesyzou@gmail.com, srv@bu.edu, adam.kalai@microsoft.com

The blind application of machine learning runs the risk of amplifying biases present in data. Such a danger is facing us with word embedding, a popular framework to represent text data as vectors which has been used in many machine learning and natural language processing tasks. We show that even word embeddings trained on Google News articles exhibit female/male gender stereotypes to a disturbing extent. This raises concerns because their widespread use, as we describe, often tends to amplify these biases. Geometrically, gender bias is first shown to be captured by a direction in the word embedding. Second, gender neutral words are shown to be linearly separable from gender definition words in the word embedding. Using these properties, we provide a methodology for modifying an embedding to remove gender stereotypes, such as the association between the words receptionist and *female*, while maintaining desired associations such as between the words *queen* and *female*. Using crowd-worker evaluation as well as standard benchmarks, we

- More on this during the last week of class

On the Dangers of Stochastic Parrots: Can Language Models Be Too Big? 🌂

Emily M. Bender* ebender@uw.edu University of Washington Seattle, WA, USA

Angelina McMillan-Major aymm@uw.edu University of Washington Seattle, WA, USA

ABSTRACT

The past 3 years of work in NLP have been characterized by the development and deployment of ever larger language models, especially for English. BERT, its variants, GPT-2/3, and others, most recently Switch-C, have pushed the boundaries of the possible both through architectural innovations and through sheer size. Using these pretrained models and the methodology of fine-tuning them for specific tasks, researchers have extended the state of the art on a wide array of tasks as measured by leaderboards on specific benchmarks for English. In this paper, we take a step back and ask: How big is too big? What are the possible risks associated with this technology and what paths are available for mitigating those risks? We provide recommendations including weighing the environmental and financial costs first, investing resources into curating and carefully documenting datasets rather than ingesting everything on the web, carrying out pre-development exercises evaluating how the planned approach fits into research and development goals and supports stakeholder values, and encouraging research directions beyond ever larger language models.

Timnit Gebru* timnit@blackinai.org Black in AI Palo Alto, CA, USA

Shmargaret Shmitchell shmargaret.shmitchell@gmail.com The Aether

alone, we have seen the emergence of BERT and its variants [39, 70, 74, 113, 146], GPT-2 [106], T-NLG [112], GPT-3 [25], and most recently Switch-C [43], with institutions seemingly competing to produce ever larger LMs. While investigating properties of LMs and how they change with size holds scientific interest, and large LMs have shown improvements on various tasks (§2), we ask whether enough thought has been put into the potential risks associated with developing them and strategies to mitigate these risks.

We first consider environmental risks. Echoing a line of recent work outlining the environmental and financial costs of deep learning systems [129], we encourage the research community to prioritize these impacts. One way this can be done is by reporting costs and evaluating works based on the amount of resources they consume [57]. As we outline in §3, increasing the environmental and financial costs of these models doubly punishes marginalized communities that are least likely to benefit from the progress achieved by large LMs and most likely to be harmed by negative environmental consequences of its resource consumption. At the scale we are discussing (outlined in §2), the first consideration should be the environmental cost.
